Terms of Use

The terms of use for this study can be found at:

<http://datafiles.samhsa.gov/terms-use-nid3422>

****Processor Note****
DC*MADS 1991:
HOMELESS AND TRANSIENT POPULATION

- 1) Column locations detailed in the codebook document the original data file. Users should refer to the SAS or SPSS data definition statement files for column locations of variables in the data file.

WARNING! DATA USE RESTRICTIONS

Read Carefully Before Using

The Public Health Service Act (Section 301) provides that the data collected by the National Institute on Drug Abuse (NIDA) may be used only for the purpose of health statistical reporting and analysis.

Any effort to determine the identity of any reported case is prohibited by this law.

NIDA does all it can to assure that the identity of data subjects cannot be disclosed. All direct identifiers, as well as any characteristics that might lead to identification, are omitted from the dataset. Any intentional identification or disclosure of a person or establishment violates the assurances of confidentiality given to the providers of the information. Therefore, users will:

1. Use the data in this dataset for statistical reporting and analysis only.
2. Make no use of the identity of any person or establishment discovered inadvertently and advise the Director, NIDA, of any such discovery.
3. Not link this dataset with individually identifiable data from other NIDA and non-NIDA datasets.

By using these data you signify your agreement to comply with the above-stated statutorily based requirements.

PREFACE

Use of DC*MADS Data on Homeless and Transients

The National Institute on Drug Abuse (NIDA) sponsored the Homeless and Transient Population Study as part of the Washington, D.C. Metropolitan Area Drug Study (DC*MADS) in 1991. Information on this study has been published in a technical report, the Executive Summary and Overview of which are reproduced as Appendix C in this document.

In preparing the public release version of the data tape, all data containing geographic detail have been recoded to State-level units only (District of Columbia, Maryland, and Virginia). Other items, such as race, were aggregated when very few individuals were found in more detailed categories. Variables with monetary values (income and expenditures) were topcoded, with a special code assigned to represent values above a cutoff point (e.g., code 999 to represent \$999 or greater). Information on attributes of the sampled institutions was suppressed to avoid potential disclosure. Some of the data contained in this tape may not have been fully edited and will require user caution; these are self-report data which may be over- or under-reported.

The codebook is organized according to the sequence of questions in the questionnaire, reproduced as Appendix B. Except for variables modified or suppressed as described above, each item in the questionnaire is referenced by its item number. The questionnaire wording is included in the codebook, along with the column location, codes and code descriptions, and the frequency distribution (unweighed) for that item. In addition, a series of new variables were created and included in this data file. Most important of these are the survey weights, stratum, and primary sampling unit variables. As described in Appendix D, the complex nature of this sample should be taken into account in the analysis of this data set. Other created variables include a series of substance use variables commonly used in analyses of drug abuse data. These and other created variables were derived from source items as documented in the descriptions for each code value.

NIDA requests the cooperation of users of this data tape in observing the following guidelines:

- Any published material derived from these data should acknowledge the National Institute on Drug Abuse as the original source. It should also include a disclaimer which credits any analyses, interpretations, or conclusions reached to the author and not to NIDA, which is responsible only for the initial date.
- Authors should provide NIDA with a reprint of published articles which utilize the DC*MADS Homeless and Transient Population Survey data. Please send reprints to:

DATA DISK CHARACTERISTICS

1991 DC*MADS Homeless and Transient Population Survey

Title: 1991 DC*MADS Homeless and Transient Population Survey Data

Data Set Name: DCMHTP.ASC (*Disk*)

Record Length: 1463

Number of Records: 908

Number of Disks: 1

Recording Mode: ASCII

Note: An ASCII file named READ.ASC is provided with minimum specifications for a SAS read input program, and may be adapted to suit other software packages.

Summary of Data Items and Location of Documentation

COLUMN LOCATION	ITEM	SUGGESTED LABEL	PAGE
1-3		Observation Sequence Number	1
		Section A: History of Homelessness	
4	A1	HAVE YOU EVER BEEN HOMELESS?	1
5-7	A2	TOTAL # OF TIMES HOMELESS	1
8-9	A3	AGE FIRST TIME YOU WERE HOMELESS	1
10-11	A4D	# OF DAYS HOMELESS THIS TIME	2
12-13	A4W	# OF WEEKS HOMELESS THIS TIME	2
14-15	A4M	# OF MONTHS HOMELESS THIS TIME	2
16-17	A4Y	# OF YEARS HOMELESS THIS TIME	3
18-19	A4AD	HOW LONG AGO # OF DAYS HOMELESS	3
20-21	A4AW	HOW LONG AGO # OF WEEKS HOMELESS	3
22-23	A4AM	HOW LONG AGO # OF MONTHS HOMELESS	3
24-25	A4AY	HOW LONG AGO # OF YEARS HOMELESS	4
26-27	A5	TYPE PLACE LIVED BEFORE BECOMING HOMELESS	4
28-29	A6A	ARRANGEMENT TO SLEEP IN THIS PLACE	4
30-31	A9	EVER STAYED IN SHELTER/EMERGENCY HOUSING	4
32-33	A10	HAVE YOU USED EMERGENCY/SOUP KITCHEN	4
34-35	A10A	# DAYS USED EMERGENCY/SOUP KITCHEN	5
36-37	A11	EVER TALKED W/SOMEONE FROM OUTREACH PGM	5
38-39	A11A	# DAYS TALKED W/SOMEONE FROM OUTREACH	5
		Section B: Specific Drug Use	
40-41	B1	AGE WHEN FIRST TRIED CIGARETTE	6
42-43	B1A	AGE WHEN STARTED SMOKING DAILY	6
44-45	B1B	WHEN WAS LAST TIME YOU SMOKED CIGARETTE	6
46-47	B1C	# CIGARETTES SMOKED PER DAY PAST 30 DAYS	6
48-49	B2	EVER DRANK ALCOHOLIC BEVERAGES	7
50-51	B2A	AGE WHEN FRST HAD GLASS ALCOHOLIC BEVRGE	7
52-53	B2B	WHEN WAS LAST TIME YOU DRANK ALCOHOL?	7
54-55	B2C	# DAYS HAD ONE OR MORE DRINKS	8
56-58	B2D	NUMBER OF DRINKS PER DAY	8
59-60	B2E	NUMBER OF DAYS DRANK 5 OR MORE DRINKS	8
61-62	B3	HAVE YOU EVER TRIED MARIJUANA/HASHISH?	9
63-64	B3A	AGE WHEN FIRST TRIED MARIJUANA OR HASH	9
65-66	B3B	LAST TIME USED MARIJUANA OR HASH	9
67-68	B3C	NUMBER OF DAYS USED MARIJUANA/HASHISH	9
69-70	B3D	TOTAL AMOUNT OF MARIJUANA USED	10
71-72	B4	EVER SNIFFED INHALANTS FOR KICKS	10
73-74	B4A	AGE WHEN FIRST USED INHALANTS	10
75-76	B4B	LAST TIME USED INHALANTS	10
77-78	B4C	NUMBER OF DAYS USED INHALANTS	11
79-80	B5	HAVE YOU EVER USED CRACK COCAINE	11
81-82	B5A	AGE WHEN FIRST USED CRACK COCAINE	11
83-84	B5B	LAST TIME USED CRACK COCAINE	11
85-86	B5C	NUMBER OF DAYS USED CRACK COCAINE	12
87-88	B5D	AMOUNT OF CRACK COCAINE USED	12
89-90	B6	HAVE YOU TRIED OTHER FORMS OF COCAINE?	12
91-92	B6A	AGE FIRST USED COCAINE OTHER THAN CRACK	12
93-94	B6B	LAST TIME USED COCAINE OTHER THAN CRACK	13
95-96	B6C	# DAYS USED COCAINE OTHER THAN CRACK	13
97-98	B6D	GRAMS OF COCAINE OTHER THAN CRACK USED	13
99-100	B6E1	SNORTED COCAINE OTHER THAN CRACK	13
101-102	B6E2	SWALLOWED COCAINE OTHER THAN CRACK	14
103-104	B6E3	INJECTED COCAINE OTHER THAN CRACK	14
105-106	B6E4	SMOKED COCAINE OTHER THAN CRACK	14
107-108	B6E5	OTHER WAY USED COCAINE OTHER THAN CRACK	14
109-110	B7	EVER TRIED HALLUCINOGENS	14

COLUMN LOCATION	ITEM	SUGGESTED LABEL	PAGE
111-112	B7A	AGE WHEN FIRST USED HALLUCINOGENS	14
113-114	B7B	LAST TIME USED HALLUCINOGENS	15
115-116	B7C	NUMBER OF DAYS USED HALLUCINOGENS	15
117-118	B8	HAVE YOU EVER USED HEROIN?	15
119-120	B8A	AGE WHEN FIRST TRIED HEROIN	15
121-122	B8B	LAST TIME USED HEROIN	16
123-124	B8C	NUMBER OF DAYS USED HEROIN W/HOMELESS	16
125-126	B8D1	USED HEROIN BY SNIFFING PAST 12 MONTHS	16
127-128	B8D2	USED HEROIN BY SWALLOWING PAST 12 MONTHS	16
129-130	B8D3	USED HEROIN BY INJECTION PAST 12 MONTHS	17
131-132	B8D4	USED HEROIN BY SMOKING IT PAST 12 MONTHS	17
133-134	B8D5	USED HEROIN OTHER WAY PAST 12 MONTHS	17
135-136	B9	HAVE YOU EVER USED METHAMPHETAMINE?	17
137-138	B9A	AGE WHEN FIRST TRIED METHAMPHETAMINE	17
139-140	B9B	LAST TIME USED METHAMPHETAMINE	18
141-142	B9C	NUMBER OF DAYS USED METHAMPHETAMINE	18
143-144	B10	TAKEN STIMULANTS FOR NONMEDICAL REASNS	18
145-146	B10A	AGE FIRST USED STIMULANTS NONMED. REASON	18
147-148	B10B	LAST TIME USED STIMULANTS NONMED. REASON	19
149-150	B10C	# DAYS USED STIMULNTS FOR NONMED. REASNS	19
151-152	B11	TAKEN SEDATIVES FOR NONMEDICAL REASNS	19
153-154	B11A	AGE WHEN FIRST TOOK A SEDATIVE	19
155-156	B11B	LAST TIME TOOK SEDATIVE NONMED. REASON	20
157-158	B11C	# DAYS USED SEDATIVES FOR NONMED. REASNS	20
159-161	B12_1	1ST OTHER DRUG TAKEN NOT ASKED ABOUT	20
162-164	B12_2	2ND OTHER DRUG TAKEN NOT ASKED ABOUT	21
165-167	B12_3	3RD OTHER DRUG TAKEN NOT ASKED ABOUT	21

Section C: General Drug Use

168-169	C1_1	USED CIGARETTES W/IN HRS OF USING ALCOHOL	22

1-3 Observation Sequence Number

908 ACTUAL NUMBER

Section A: History of Homelessness

The phrase "homeless" is used to describe people who do not sleep in a room, apartment or house of their own and who sometimes stay in a shelter, emergency housing, a car, a campground, or have to search for other places to sleep. The first few questions are about being homeless. [IF 1, SKIP TO A2]

4 A1 Have you ever been homeless?

850 1=Yes
 2 2=No
 27 3=Edited Yes from Section A
 29 4=Edited Yes from Section I

5-7 A2 (Including this time), how many times in your life have you been homeless? That is, not living in your own room, apartment, or house for a night or more?

32 -9=Legitimate skip (only for soup kitchen respondents who had never been homeless)
 12 -8=Missing
 2 -5=Bad or illegible data
 4 -4=Don't know

Shelter-Sampled Respondent Introduction and Consent

Hello, my name is _____, and I'm from the Research Triangle Institute. We are doing a study in the D.C. metropolitan area for the U.S. Department of Health and Human Services. I have some questions about housing, and some questions about drug use, including alcohol and tobacco. It will only take about 40 to 50 minutes. In return, we will give you \$10 for your time.

You should answer the questions as honestly as you can. Any information you give me is strictly confidential and will only be used by the research staff. Your answers will not be shared with any of the shelter staff and will not affect your ability to stay at the shelter.

The privacy of your answers is protected. We will not record your name or social security number anywhere. We also have a Federal Certificate of Confidentiality. (SHOW R). This means that nothing you tell me can be subpoenaed or used against you in any legal proceeding.

I would like you to understand that your participation is voluntary. You may withdraw from the interview at any time, or, if there are questions you don't want to answer, you don't have to. (PAUSE TO ANSWER ANY QUESTIONS.)

If it's alright with you, let's get started. I will sign my name here, which shows that you have given me your permission to do this interview.

Soup Kitchen-Sampled Respondent Introduction and Consent

Hello, my name is _____, and I'm from the Research Triangle Institute. We are doing a study in the D.C. metropolitan area for the U.S. Department of Health and Human Services. The purpose of the study is to find out how many homeless and transient people have problems, the help that they need and the extent to which their needs are being met. I have some questions about housing, and some questions about drug use, including alcohol and tobacco. It will only take about 40 to 50 minutes. In return, we will give you \$10 for completing the interview.

You should answer the questions as honestly as you can. Any information you give me is strictly confidential and will only be used by the research staff. Your answers will not be shared with any of the program staff and will not affect your ability to receive food, medical or other services from this program.

The privacy of your answers is protected. We will not record your name or social security number anywhere. We also have a Federal Certificate of Confidentiality. (SHOW R). This means that nothing you tell me can be subpoenaed or used against you in any legal proceeding. (OFFER R A COPY TO KEEP)

I would like you to understand that your participation is voluntary. You may withdraw from the interview at any time, or, if there are questions you don't want to answer, you don't have to. (PAUSE TO ANSWER ANY QUESTIONS. OFFER R A COPY OF THE STUDY BROCHURE TO KEEP.)

If it's alright with you, let's get started. I will sign my name here, which shows that you have given me your permission to do this interview.

A. HISTORY OF HOMELESSNESS

The phrase "homeless" is used to describe people who do not sleep in a room, apartment or house of their own and who sometimes stay in a shelter, emergency housing, a car, a campground, or have to search for other places to sleep. The first few questions are about being homeless.

A-1. Have you ever been homeless?

YES.....01 → [GO TO A-2]

NO.....02

PROBE FOR NONCONVENTIONAL HOUSING. IF APPLICABLE, READ THE FOLLOWING STATEMENT:

IF NOT APPLICABLE, SKIP TO A-9, AND USE 30 DAYS FOR A-4.

Rather than ask about homelessness, I am going to ask you about things that have happened since you lived in (TYPE OF NONCONVENTIONAL HOUSING).

A-2. (Including this time), how many times in your life have you been homeless? That is, not living in your own room, apartment, or house for a night or more?

TIMES:..... _ _ _

A-3. How old were you the first time you were homeless?

AGE:..... _ _

A-4. How long (have you been homeless this time/were you homeless the last time) ? (IF LESS THAN 30 DAYS, PROBE AND RECORD IN DAYS)

DAYS:..... _ _

WEEKS:..... _ _

MONTHS:..... _ _

YEARS:..... _ _

FOR SUBSEQUENT QUESTIONS, USE ANSWER FROM A-4 IF LESS THAN 30 DAYS; USE 30 DAYS IF A-4 IS MORE THAN 30 DAYS OR IF R IS NOT CURRENTLY HOMELESS

IF R IS CURRENTLY HOMELESS, SKIP TO A-5

A-4a. How long ago did your last period of homelessness end?

DAYS:..... _ _

WEEKS:..... _ _

MONTHS:..... _ _

YEARS:..... _ _

A-5. In what kind of place did you live before you became homeless (this/the last) time?

- A house.....01
- An apartment.....02
- A room, paid for by R.....03
- A boat.....04
- Some other form of regular housing.....05
- (SPECIFY) _____

A-6. Who did that place belong to? By belong, I mean who paid the rent or mortgage or owned it?

- Self.....01
- Spouse.....02
- Parent.....03
- Other relative.....04
- Sexual partner.....05
- Friend.....06
- Someone else.....07
- (SPECIFY) _____

→ [SKIP TO A-7]

A-6a. Did you have an arrangement with your (parent/relative/partner/ friends/this person) to sleep in their place on a regular basis?

YES.....01

NO.....02

A-7. In what city or county was that place located? (PROBE: In what state, district, or territory is that?) (RECORD LOCATION)

- Alexandria, VA.....01
- Arlington, VA.....02
- Calvert County, MD.....03
- Charles County, MD.....04
- District of Columbia (DC).....05
- Fairfax City, VA.....06
- Fairfax County, VA.....07
- Falls Church City, VA.....08
- Frederick County, MD.....09
- Loudoun County, VA.....10
- Manassas City, VA.....11
- Manassas Park City, VA.....12
- Montgomery County, MD.....13
- Prince George's County, MD.....14
- Prince William County, VA.....15
- Stafford County, VA.....16
- Other (SPECIFY) _____ 17

→ FOR OFFICE
USE ONLY

A-8. In what city or county did you sleep (last night/two nights ago)? (PROBE: In what state, district, or territory is that?) (RECORD LOCATION)

- Alexandria, VA.....01
- Arlington, VA.....02
- Calvert County, MD.....03
- Charles County, MD.....04
- District of Columbia (DC).....05
- Fairfax City, VA.....06
- Fairfax County, VA.....07
- Falls Church City, VA.....08
- Frederick County, MD.....09
- Loudoun County, VA.....10
- Manassas City, VA.....11
- Manassas Park City, VA.....12
- Montgomery County, MD.....13
- Prince George's County, MD.....14
- Prince William County, VA.....15
- Stafford County, VA.....16
- Other (SPECIFY) _____ 17 →

FOR OFFICE USE ONLY ---

A-9. Have you ever stayed in a shelter or emergency housing?

- YES.....01
- NO.....02 → [SKIP TO A-10]

A-9a. Did you spend any part of last night in a shelter or motel for the homeless?

- YES.....01
- NO.....02

A-9b. During the past (# from A-4) days, (while you have been homeless,) on about how many different nights have you stayed in a shelter or emergency housing?

- NIGHTS:.....
- NONE.....00

A-9c. Did you spend any time outside of your home or a shelter between 4:00AM and 5:30AM this morning?

- YES.....01
- NO.....02

A-10. Have you ever used an emergency or soup kitchen?

YES.....01

NO.....02 → [SKIP TO A-11]

A-10a. During the past (# from A-4) days, (while you have been homeless,) on about how many different days have you used an emergency or soup kitchen?

DAYS:.....__ __

A-11. Have you ever talked with someone from an outreach program like Health Care for the Homeless, McKinney Program, or other groups?

YES.....01

NO.....02 → [SKIP TO SECTION B]

A-11a. During the past (# from A-4) days, (while you have been homeless,) on about how many different days have you talked with someone from an outreach program?

DAYS:.....__ __

B. SPECIFIC DRUG USE

Now I would like to ask you about your use of drugs, including tobacco and alcohol.

B-1. About how old were you when you first tried a cigarette?

AGE:.....

NEVER TRIED A CIGARETTE.....91 → [SKIP TO B-2]

B-1a. About how old were you when you first started smoking daily?

AGE:.....

NEVER SMOKED DAILY.....91

B-1b. When was the last time you smoked a cigarette?

(SHOW RECENCY CARD, IF NECESSARY)

Within the past week (7 days).....01

Within the past month (30 days).....02

1 or more months ago, but less than
6 months ago.....03

6 or more months ago, but less than
1 year ago.....04

1 or more years ago, but less than
3 years ago.....05

3 or more years ago.....06

→ [SKIP TO B-2]

B-1c. How many cigarettes have you smoked per day, on the average, during the past 30 days? Give me the average number per day.

Less than one cigarette a day.....01

1-5 cigarettes a day.....02

About 1/2 pack a day (6-15 cigarettes).....03

About 1 pack a day (16-25 cigarettes).....04

About 1 1/2 packs per day
(26-35 cigarettes).....05

About 2 packs or more a day (over 35
cigarettes).....06

B-2. Have you ever, even just once, drunk alcoholic beverages? This includes beer, wine, or liquor, like whiskey, gin, or scotch, including mixed alcoholic drinks like gin and tonic.

YES.....01

NO.....02 → [SKIP TO B-3]

B-2a. About how old were you the first time you had a glass of beer or wine or a drink of liquor, such as whiskey, gin, or scotch? Do not include childhood sips that you might have had from an older person's drink.

AGE:.....__ __

B-2b. When was the last time you drank any alcohol?

(SHOW RECENCY CARD, IF NECESSARY)

- | | | |
|--|----|-------------------|
| Within the past week (7 days)..... | 01 | |
| Within the past month (30 days)..... | 02 | |
| 1 or more months ago, but less than
6 months ago..... | 03 | } → [SKIP TO B-3] |
| 6 or more months ago, but less than
1 year ago..... | 04 | |
| 1 or more years ago, but less than
3 years ago..... | 05 | |
| 3 or more years ago..... | 06 | |

B-2c. During the past (# from A-4) days, (while you've been homeless,) on about how many different days did you have one or more drinks?

NUMBER OF DAYS:...__ __

NONE.....00 → [SKIP TO B-3]

Now, I would like to ask you some questions about those (ANSWER FROM B-2c) days when you had one or more drinks.

B-2d. About how many drinks did you usually have in a day on those (ANSWER FROM B-2c) days?

USUAL NUMBER OF DRINKS PER DAY:.....__ __ __

B-2e. On about how many of those (ANSWER FROM B-2c) days did you have five or more drinks on the same occasion? By occasion we mean at the same time or within a couple of hours of each other.

NUMBER OF DAYS DRANK FIVE
OR MORE DRINKS:__ __

B-3. The next questions are about marijuana use. Have you ever, even just once, tried marijuana or hashish?

YES.....01

NO.....02 → [SKIP TO B-4]

B-3a. About how old were you the first time you tried marijuana or hash?

AGE:.....

B-3b. When was the last time you used marijuana or hash?

(SHOW RECENCY CARD, IF NECESSARY)

- Within the past week (7 days).....01
- Within the past month (30 days).....02
- 1 or more months ago, but less than
6 months ago.....03
- 6 or more months ago, but less than
1 year ago.....04
- 1 or more years ago, but less than
3 years ago.....05
- 3 or more years ago.....06

→ [SKIP TO B-4]

B-3c. During the past (# from A-4) days, (while you've been homeless,) on about how many different days did you use marijuana or hash?

DAYS:.....

NONE:.....00 → [SKIP TO B-4]

B-3d. What is the total amount of marijuana that you used, in all, during the past (# from A-4) days, while you've been homeless? (IF NECESSARY, PROBE WITH CATEGORIES TO CLARIFY)

- Less than 1/4 ounce (up to 5 grams or
10 joints).....01
 - About 1/4 ounce (6-10 grams or 11-20
joints).....02
 - About 1 ounce (11-42 grams or 21-85
joints).....03
 - About 2 ounces (43-72 grams or 86 to 145
joints).....04
 - About 3-4 ounces (73-127 grams or 146-255
joints).....05
 - About 5-6 ounces (128-185 grams or
256-370 joints).....06
 - More than 6-1/2 ounces.....07
- (SPECIFY) _____

B-4. Have you ever, even just once, inhaled or sniffed (breathed or huffed) inhalants for kicks or to get high? These include things like lighter fluid, aerosol sprays, glue, amyl nitrite, "poppers", or locker room odorizers.

YES.....01

NO.....02 → [SKIP TO B-5]

B-4a. About how old were you the first time you inhaled or sniffed (breathed or huffed) one of these inhalants for kicks or to get high?

AGE:.....__ __

B-4b. When was the last time you inhaled or sniffed (breathed or huffed) one of these inhalants for kicks or to get high?

(SHOW RECENCY CARD, IF NECESSARY)

- Within the past week (7 days).....001
- Within the past month (30 days).....02
- 1 or more months ago, but less than
6 months ago.....03
- 6 or more months ago, but less than
1 year ago.....04
- 1 or more years ago, but less than
3 years ago.....05
- 3 or more years ago.....06

→ [SKIP TO B-5]

B-4c. During the past (# from A-4) days, (while you've been homeless,) on about how many different days did you use an inhalant for kicks or to get high?

DAYS:.....__ __

B-5. Now I'd like to ask about cocaine use. First, I'll ask you about "crack" cocaine, that is, cocaine in rock or chunk form. Have you ever, even just once, tried "crack" cocaine?

YES.....01

NO.....02 → [SKIP TO B-6]

B-5a. About how old were you the first time you used "crack" cocaine?

AGE:.....__ __

B-5b. When was the last time you used "crack" cocaine?

(SHOW RECENCY CARD, IF NECESSARY)

- Within the past week (7 days).....01
- Within the past month (30 days).....02
- 1 or more months ago, but less than
6 months ago.....03
- 6 or more months ago, but less than
1 year ago.....04
- 1 or more years ago, but less than
3 years ago.....05
- 3 or more years ago.....06

→ [SKIP TO B-6]

B-5c. During the past (# from A-4) days, (while you've been homeless,) on how many different days did you use "crack" cocaine?

DAYS:.....

NONE:.....00 → [SKIP TO B-6]

B-5d. How many grams of crack cocaine have you used during the past (# from A-4) days, while you've been homeless? (IF NECESSARY, PROBE WITH CATEGORIES TO CLARIFY)

- Less than 1/4 gram (1/2 vial or 3 crack rocks).....01
 - About 1/4 gram (1 vial or 4-5 crack rocks).....02
 - About 1/2 gram (1 1/2-3 vials or 6-12 crack rocks).....03
 - About 1 gram (3 1/2-5 vials or 13-25 crack rocks).....04
 - About 2 grams (6-12 vials or 26-45 crack rocks).....05
 - More than 2-1/2 grams.....06
- (SPECIFY) _____

B-6. Have you ever, even just once, tried other forms of cocaine? This includes cocaine in the form of powder, free base, or a coca paste.

YES.....01

NO.....02 → [SKIP TO B-7]

B-6a. About how old were you the first time you tried cocaine other than crack?

AGE:.....

B-6b. When was the last time you used cocaine other than crack?

(SHOW RECENCY CARD, IF NECESSARY)

- Within the past week (7 days).....01
- Within the past month (30 days).....02

- 1 or more months ago, but less than 6 months ago.....03
 - 6 or more months ago, but less than 1 year ago.....04
- [SKIP TO B-6e]

- 1 or more years ago, but less than 3 years ago.....05

B-12. Have you ever, even just once, taken any other drugs I have not asked you about? Please do not include drugs according to a doctor's prescription. (IF YES, PROBE:) What drug(s) (was/were) (that/those)?

NO.....000

FOR OFFICE
USE ONLY

C. GENERAL DRUG USE

Now, I'd like to ask some general questions about drug use and alcohol use.

(SHOW SUBSTANCE CARD)

I would like you to refer to this card when responding to the questions. You can tell me either the name or number for your answers.

C-1. In the last 12 months which of these drugs, if any, did you use at the same time or within a couple of hours of when you drank beer, wine, or liquor? (CIRCLE ALL THAT APPLY)

CIGARETTES.....	01
ALCOHOL.....	02
(beer, wine, hard liquor)	
MARIJUANA.....	03
(reefer, hash, THC)	
INHALANTS.....	04
(glue, amyl nitrite, poppers, aerosol sprays)	
CRACK COCAINE.....	05
OTHER COCAINE.....	06
HALLUCINOGENS.....	07
(LSD, PCP, peyote, mescaline, ecstasy)	
HEROIN.....	08
SMOKABLE METHAMPHETAMINE.....	09
(ice)	
OTHER STIMULANTS.....	10
(amphetamines, forms of metham- phetamines other than ice, Preludin, uppers, speed)	
SEDATIVES.....	11
(barbituates, sleeping pills, Seconal, downers)	
TRANQUILIZERS.....	12
(Librium, Valium, benzodiazepine)	
ANALGESICS.....	13
(Darvon, Demerol, Talwin, Talacen)	
OTHER (SPECIFY)	14
<hr/>	
DID NOT USE DRUGS WITH ALCOHOL IN PAST 12 MONTHS.....	91
DID NOT USE ANY DRUGS.....	92

IF R HAS NEVER USED DRUGS OTHER THAN ALCOHOL, SKIP TO C-4

C-2. Have you ever used a needle to get any drug injected under your skin, into a muscle, or into a vein for nonmedical reasons?

YES.....01

NO.....02 → [SKIP TO C-3]

C-2a. Which of these drugs did you ever get injected into yourself with a needle, for nonmedical reasons? (CIRCLE ALL THAT APPLY)

CIGARETTES.....	01
ALCOHOL.....	02
(beer, wine, hard liquor)	
MARIJUANA.....	03
(reefer, hash, THC)	
INHALANTS.....	04
(glue, amyl nitrite, poppers, aerosol sprays)	
CRACK COCAINE.....	05
OTHER COCAINE.....	06
HALLUCINOGENS.....	07
(LSD, PCP, peyote, mescaline, ecstasy)	
HEROIN.....	08
SMOKABLE METHAMPHETAMINE.....	09
(ice)	
OTHER STIMULANTS.....	10
(amphetamines, forms of metham- phetamines other than ice, Preludin, uppers, speed)	
SEDATIVES.....	11
(barbituates, sleeping pills, Seconal, downers)	
TRANQUILIZERS.....	12
(Librium, Valium, benzodiazepine)	
ANALGESICS.....	13
(Darvon, Demerol, Talwin, Talacen)	
OTHER (SPECIFY)	14

(TAKE BACK CARD)

C-2b. When was the last time you used any drug for nonmedical reasons with a needle?

(SHOW RECENCY CARD, IF NECESSARY)

Within the past week (7 days).....	01
Within the past month (30 days).....	02
1 or more months ago, but less than 6 months ago.....	03
6 or more months ago, but less than 1 year ago.....	04
1 or more years ago, but less than 3 years ago.....	05
3 or more years ago.....	06

C-2c. Have you ever used a needle that you know or suspect has been used by someone else including family members to inject drugs?

YES.....01

NO.....02 → [SKIP TO C-2e]

For the next questions, I would like you to answer some questions about drugs you have injected in the last 12 months. Please respond with one of the categories from this card.

(HAND R NEEDLE USE CARD)

C-2d. During the past 12 months, how often did you use a needle or syringe that someone else may have used? (CIRCLE ONE)

- Never.....01
- Rarely or almost never.....02
- Occasionally.....03
- About half the time.....04
- Most of the time.....05
- Almost always.....06
- Always.....07

C-2e. Have you ever let someone else including family members use your needle to inject drugs?

YES.....01

NO.....02 → [SKIP TO C-2g]

C-2f. During the past 12 months, how often did you let someone else use your needle to inject drugs? (CIRCLE ONE)

- Never.....01
- Rarely or almost never.....02
- Occasionally.....03
- About half the time.....04
- Most of the time.....05
- Almost always.....06
- Always.....07

C-2g. During the last 12 months, how often did you shoot up in a shooting gallery?
(CIRCLE ONE)

- Never.....01
- Rarely or almost never.....02
- Occasionally.....03
- About half the time.....04
- Most of the time.....05
- Almost always.....06
- Always.....07

C-2h. During the last 12 months, how often did you clean your works with alcohol or bleach or by boiling them? (CIRCLE ONE)

- Never.....01
- Rarely or almost never.....02
- Occasionally.....03
- About half the time.....04
- Most of the time.....05
- Almost always.....06
- Always.....07

(TAKE BACK CARD)

C-2i. During the past 12 months, with how many people in all have you shared your works?

NUMBER OF PEOPLE: . _ _ _ _

C-3. On those occasions that you have used drugs, where did you usually use them? (PROBE: For example [READ FROM LIST])

(CIRCLE ALL THAT APPLY)

- At home.....01
 - At someone else's home.....02
 - At a party.....03
 - At a shooting gallery.....04
 - In an open place (park, street, vacant building) or in a car.....05
 - Somewhere else? (PROBE: Where?).....06
-

C-3a. Who were you usually with when you used drugs other than alcohol? (PROBE: For example [READ FROM LIST])

(CIRCLE ALL THAT APPLY)

- Alone.....01
- Sexual partner.....02
- Family.....03
- Friends.....04
- Running/walking partner.....05
- Someone else.....06

I am going to read you some activities having to do with alcohol and drug use.

Please tell me how much you think people risk harming themselves physically or in other ways for each activity I read. Tell me if this activity puts people at "no risk", "slight risk", "moderate risk", or "great risk".

	<u>No Risk</u>	<u>Slight Risk</u>	<u>Moderate Risk</u>	<u>Great Risk</u>
C-4a. Smoking marijuana regularly?.....	01	02	03	04
C-4b. Smoking marijuana occasionally?.....	01	02	03	04

Appendix C

Summary of DC*MADS Homeless and Transient Population Study

(Adapted from Appendix A of NIDA's *Prevalence of Drug Use in the Washington, DC, Metropolitan Area Homeless and Transient Population, 1991.*)

EXECUTIVE SUMMARY

This report examines the prevalence of illicit drug use and related problems among members of the homeless and transient population, aged 12 and older in the District of Columbia Metropolitan Statistical Area (DC MSA). It also provides information on alcohol use, criminal activity, physical health, mental health, employment, receipt of services, and entitlement participation among homeless people. This research is part of the Washington, D.C., Metropolitan Area Drug Study (DC*MADS).

The goal of the DC*MADS Homeless and Transient Population Study was to provide unbiased estimates for an "average" day in the DC MSA from February through June 1991. Findings are based on 908 in-person interviews conducted anonymously from four overlapping sampling frames: 477 interviews with residents in 93 shelters; 224 interviews with patrons of 31 soup kitchens and food banks; 143 interviews with literally homeless people from 18 major clusters of encampments; and 64 interviews with literally homeless people from an area probability sample of 432 census blocks in the MSA. The institutional response rate for shelters and soup kitchens combined was 82.6%. The response rate for eligible individuals across the four frames was 86.1%.

Some of the key findings from the report include:

- There are from 9,031 to 11,743 homeless or transient people in the DC MSA on an average day. Over 42% of these people, however, come into contact with multiple parts of the service system and represent 14,744 person-contacts. This means that even in a single day there is a high likelihood of double counting. It also means that 93% of homeless people can be identified directly through the service system in a single day and 98% can be identified in the course of a month.
- Rates of any illicit drug use among homeless people were 80% over their lifetime, 58% in the past year, and 34% in the past month. These rates were influenced more by use of cocaine than by use of marijuana. The rates of cocaine use were 65% in their lifetime, 48% in the past year, and 28% in the past month.
- Rates of alcohol use among this population were 93% in their lifetime, 86% in the past year, and 70% in the past month. The latter includes 28% who were drinking heavily (five or more drinks per day on a weekly basis) while homeless during the past month.

- Approximately 28% of the homeless people had lifetime histories of mental health treatment and 25% had experienced four or more mental health problems in the past month (e.g., significant periods of arguing, depression, anxiety, suspicion, suicidal thoughts or attempts). Only 5% were currently receiving mental health treatment.
- Roughly half of the homeless population had been involved in one or more criminal activities in their lifetime, and more than 30% had been arrested at least once. Current drug users were more likely than nonusers of drugs to have committed a criminal act in their lifetime (64% vs. 14%) been involved in drug-related criminal activities in the past year (73% vs. 8%), and to have been arrested one or more times in the past year (53% vs. 8%).
- More than 70% of the homeless people had at least one major medical problem in the past year, and 7% had four or more. This includes 12% (20% of current drug users) with one or more drug-related illnesses such as the acquired immune deficiency syndrome (AIDS), sexually transmitted diseases (STDs), tuberculosis, or hepatitis. Along with these problems and their rates of visiting hospitals (25%) and emergency rooms (37%) in the past year, only 36% of the homeless population had any public or private health insurance.
- Although 99% of the homeless population had been employed in their lifetime, fewer than 39% had worked in the past month, and about 20% described themselves as currently working full-time. Of the rest, about 8% reported themselves as currently too disabled to work, and another 11% had given up searching for employment. An estimated 27% reported receiving some form of disability or unemployment insurance in their lifetime, and the mean income from such sources was \$43 per month.
- An estimated 97% of the homeless population in this study fell into one or more of the special groups identified in the Stewart B. McKinney Homeless Assistance Act of 1987. Some of the largest groups included those who had experienced one or more major illnesses (70%), were currently unemployed (54%), had problems with drug use (34%) or heavy alcohol use (28%), had histories of mental treatment (28%), or were the head of a family (23%), were veterans (22%), or were youths (5%). About 58% had one or more problems with alcohol, drug use, or mental illness.
- Methodologically, population coverage by frame indicates that shelters alone cover a little over half of the total homeless population (56%) on an average day. After adjusting for potential overlap, the addition of soup kitchens raised the total coverage to 93%, the addition of encampments raised it to 94%, and the addition of the streets provided 100% coverage. Omitting the street frame, the coverage of the remaining three sites was lower for selected groups such as youths (85%), heavy alcohol users (86%), and the unemployed (90%), and it was higher for current drug users (98%), veterans (97%), and families (95%).

- Adding homeless people to the NHSDA population of past year injection drug use in the DC MSA would increase the latter from 0.2% to 0.25% (25%). This difference is too small to change prevalence estimates noticeably, but would result in a 25% increase in the population estimates often used by providers for estimating the number of people in need of treatment. Thus, while the addition of 1,402 past year needle users is small relative to the total household population (3,174,498 people in the MSA), it is large relative to the size of the treatment population.

Homelessness and drug use are associated with many problems that stress emotional, psychological, and financial resources. This report provides estimates for some of these problems among the homeless population in the DC MSA. It also describes the methodologies used to develop these prevalence measures to serve as a model for future studies on hard-to-reach and hidden populations.

1.0 INTRODUCTION AND BACKGROUND

1.1 Purpose and Organisation of This Report

The problems of homelessness and drug abuse are increasingly being seen in communities across the Nation, most often in major urban areas (Interagency Council on the Homeless, 1991). Like other large metropolitan areas, the District of Columbia Metropolitan Statistical Area (DC MSA), shown in Figure 1.1, has been experiencing problems with homelessness and drug abuse. In the 1990 U.S. census, more than 6,500 people spent the night in emergency shelters in the DC MSA, including over 4,400 in the District. The census showed that, although Washington, DC, is only the 19th largest city in the U.S. (1990 population of about 606,900), it has the 4th largest shelter population and the highest rate of shelter residents per capita (72.81 per 10,000; see Barrett, Anolik, & Abramson, 1992). Regarding drug use, Milburn, Booth, and Miles (1990) found that 60% of a random sample of DC shelter residents had used illicit drugs in their lifetime and 24% had used drugs in the past month. These rates of drug use may not provide an accurate prevalence estimate because shelter samples are not representative of the total homeless population. For example, relying on shelter samples alone to estimate drug prevalence was found inaccurate in a study of nine shelters in northern Virginia (Davidson, 1991). Substance abuse, mental illness, and mental retardation considered together were significantly more common among people on shelters' "do not admit" lists than among shelter residents (96% vs. 67%). To achieve greater representation, the current study included homeless people from shelters, soup kitchens, major encampments, and a random sample of census blocks from the entire DC MSA.

This report presents findings about the prevalence of illicit drug use and correlated problems among members of the homeless and transient population, aged 12 and older, in the DC MSA. It provides information on problems, services, and treatment related to drug and alcohol use, criminal activity, physical health, mental health, employment, and entitlement participation among homeless people. This study is one of the special population based studies included in the Washington, DC, Metropolitan Area Drug Study (DC*MADS) and was designed to be comparable with the 1990 and 1991 National Household Survey on Drug Abuse (NHSDA) and with the other DC*MADS population-based studies.

Figure 1.1 District of Columbia Metropolitan Statistical Area (DC MSA)

Note: The District of Columbia Metropolitan Statistical Area (DC MSA) includes the District of Columbia; the Maryland counties of Calvert, Charles, Frederick, Montgomery, and Prince Georges; the Virginia counties of Arlington, Fairfax, Loudoun, Prince William, and Stafford; and the Virginia cities of Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park.

The remainder of this chapter provides an overview of DC*MADS and its Homeless and Transient Population Study. It describes related prior research on homeless people and discusses special issues related to the definition and coverage of the homeless population. Chapter 2.0 summarizes the methodology, response rates, and analytic approach. A detailed methodological discussion appears in *Appendix C*, including an explanation of the weighting procedures; the actual geographic, institutional, and individual samples used; the response rates; a description of the software used to analyze the data; the rule for identifying estimates with low precision; and other issues.

1.2 Overview of the Washington, DC, Metropolitan Area Drug Study

DC*MADS is an exploratory attempt to look at the nature and extent of drug abuse among all types of people residing in a single metropolitan area during the same period of time, with special focus on populations who are under represented or unrepresented in the NHSDA. Many of these sub populations represent people who tend to be at risk for drug abuse and its consequences. The main objectives of DC*MADS are to:

- estimate the prevalence, correlates, and consequences of drug abuse among the diverse populations residing in the metropolitan area, and
- develop a research model for similar data collection about drug abuse in other major metropolitan areas.

DC*MADS consists of numerous studies that focus on different population subgroups (e.g., homeless people, institutionalized individuals) or different aspects of the drug abuse problem (e.g., adverse consequences from drug abuse) in the Washington metropolitan area.

The studies include:

- Household and Nonhousehold Populations Study;
- Homeless and Transient Population Study;
- Institutionalized Study;
- Adult Criminal Offenders Study;
- Juvenile Offenders Study;
- School Dropouts Study;
- Current Drug Abuser Characteristics Study;
- Area Opinion Leaders Study;
- Drug Abusing Subgroups Study;

- Adverse Effects of Drug Abuse Study; and
- Drug Use and Pregnancy Study.

The data and findings for DC*MADS are supplemented with data from the 1990 and 1991 NHSDA (both of which oversampled the DC metropolitan area) and the 1991 Drug Abuse Warning Network (DAWN).

1.3 Overview of the Homeless and Transient Population Study

The Homeless and Transient Population Study examined the nature and extent of drug use among people living in nonconventional dwellings (e.g., vacant buildings, cars, parks, streets, and emergency shelters) or at risk of becoming homeless in the DC MSA, as indicated by their use of soup kitchens and food banks for homeless people. It examined the reasons that people move in and out of homelessness, the roles of drug use and crime-related activities, and the problems of mental health, primary care, and economics in this movement. More specifically, this report:

- provides an overview of the prevalence of use of illicit drugs, alcohol, and tobacco for the DC MSA homeless and transient population found in shelters, soup kitchens, encampments, and street locations from February to June 1991;
- examines demographic correlates of homelessness and illicit drugs and alcohol use, including gender, age, race/ethnicity, marital status, geographic location (DC, Maryland, Virginia), education, and employment;
- examines homelessness correlates of illicit drug and alcohol use, including stage of homelessness, service use patterns, sampling location and institutional context;
- identifies the patterns, current context, and histories of drug use in the homeless population;
- analyzes current and past illicit drug use in relation to drug and alcohol treatment, mental health problems and treatment, physical health problems and treatment, illegal activity and incarceration, and unemployment and entitlement participation;
- examines methodological implications for coverage of the homeless and household population relative to overall prevalence rates and studies of illicit drug users; and
- looks at the methodological implications of the overlap among various segments of the homeless and transient population, selected subgroups targeted under the 1987 Stewart B. McKinney Homeless Assistance Act, the household population, and other sub populations studied in DC*MADS.

Interviews were conducted with 908 homeless people on 64 randomly selected nights during the winter, spring, and summer of 1991. They were randomly sampled from individuals who spent the night in emergency shelters or hotels for homeless people, used soup kitchens,

were in major encampments, or were in a geographic sample of census blocks in the 16 city and county municipalities that make up the DC MSA.

1.4 Prior Studies of Drug Use Among People Who Are Homeless

Drug use is recognized as a major problem affecting about one-third of the people who are homeless and has been documented through survey and urinalysis data (Interagency Council on the Homeless, 1991). In her review of 80 earlier studies, however, Fischer (1989) found that the estimated rates of drug use ranged from 1% to 90%. This variation is likely to stem from differences in the types of sites used, definitions of homelessness, and variability in eligibility criteria for admission to shelters and access to services. Noted below are highlights of findings from studies undertaken since Fischer's review that have focused on homelessness and alcohol and drug use.

- The New York City Commission on the Homeless (1992) found that self-reported drug or alcohol use ranged from 3% among the women in single shelters to 12% among the men in single shelters. Urine tests with a smaller sample of volunteers, however, were 30% to 80% positive for illicit drugs. Drug use was highest in the "warehouse" type of shelters and lowest in the "specialized" shelters.
- Spinner and Leaf (1992) found that, in a sample of New Haven shelter residents, 54% reported using drugs in the past month and 7% identified alcoholism or drug use as the major reason for their becoming homeless.
- Davidson (1991) found that the combined rate of substance abuse, mental illness, and mental retardation was 67% among people served by nine shelters in Northern Virginia but reached a nearly universal 96% rate among those who were on the shelters' "do not admit" list on the same day.
- Milburn and colleagues (1990) found that, in a 1988 random sample of shelter residents in DC, 60% reported lifetime illicit drug use, 35% past year use, and 24% past month use.
- Johnson and Barrett (1991) found that, in a sample of shelter, soup kitchen, and single room occupancy (SRO) hotel users in Cook County, 60% reported lifetime use of illicit drugs, 35% past year use, and 20% past month use.
- Koegel, Burnam, and Farr (1990) found that 66% of homeless people from shelter and soup kitchen samples in Los Angeles had problems with mental illness, substance abuse, or both (based on criteria of the Diagnostic and Statistical Manual of Mental Disorders, Third Edition Revised, DSM-III-R; see American Psychiatric Association [APA], 1987), and that they appeared as likely to spend time in the streets as in shelters.
- Gelberg and Linn (1989) found that, in a purposive sample of shelter and street people in Los Angeles, 50% were current users of illicit drugs.

- Rossi (1989) found that, in a shelter and street sample in Chicago, 33.2% had been in detoxification one or more times and 10.1% were unable to work because of alcoholism.
- Breakey and colleagues (1989) found that 17% of the women and 22% of the men interviewed in jails and shelters in Baltimore met the DSM-III-R criteria for drug dependence or abuse.
- Burt and Cohen (1989) and Burt (1992) found that, in a national sample of shelter and soup kitchen users, 37% of the men, 19% of the single women, and 7% of the women with children had received inpatient treatment for chemical dependency.
- Susser, Struening, and Conover (1989) found that 38% of the men entering New York City shelters for the first time had used a drug other than marijuana 50 or more times.
- Vernez and colleagues (1988) found that 48% of the homeless people using shelters, soup kitchens, or encampments in three California counties met DSM-III-R criteria for drug dependence, with 22% being dually diagnosed with a mental problem.

Several conclusions follow from this review. First, the rates of lifetime, past year, and past month illicit drug use are higher in homeless subpopulations than in the household population (e.g., in the National Institute on Drug Abuse's 1990 NHSDA [NIDA, 1991b]: 37% of the population aged 12 and older indicated lifetime drug use, 13% past year drug use, and 6% past month drug use). Second, samples from shelters only (i.e., samples that do not include persons from soup kitchens or street/encampments) are likely to under represent the extent of drug use among the homeless population. Third, there is wide variability across geographic areas, institutions, and homeless population subgroups in the extent of drug use.

1.5 Special Methodological Issues

1.5.1 Definitions of Homelessness

A "literal" definition of being homeless has been in use since the early 1980s that emphasizes an immediate lack of housing. Those who slept in non domiciles (e.g., streets, encampments, vacant buildings) or emergency shelters were considered homeless. A methodological advantage of this definition is that the universe of homeless persons can be quantified by examining where someone slept on a given night (Rossi, 1989). This "literal" definition of homelessness has been used in prior studies, including the Robert Wood Johnson Study in Chicago (Rossi, Fisher, & Willis, 1986) and the Food and Nutrition Service's National Study (Burt & Cohen, 1988).

The "literal" definition of homelessness has disadvantages, however. The first is that the line between people who are literally homeless and those who are precariously housed and/or poor is thin and easily crossed (Rossi, 1989). Consequently, a literal point-in-time definition often excludes people who may be of interest, including many who may reside in low cost hotels or who once were viewed as fitting the stereotype of a homeless person. Second,

this definition may exclude people who use homeless services and are eligible for assistance under the 1987 Stewart B. McKinney Homeless Assistance Act (see also Dennis, 1991; James, 1991). Third, the episodic nature of homelessness can make broader definition more useful for program planners and clinicians. Santiago and colleagues (1988), for instance, found that changing their definition from "currently homeless" to "homeless in the last 3 months" increased the number of people identified as homeless from 106 to 159 (50%) in a sample of 475 patients from the Kino Hospital Psychiatric Unit in Phoenix, Arizona. This latter group is at risk of becoming homeless again and may be in need of after care services that would be given to the "currently homeless."

More recent definitions have included people who are literally homeless and who are in transition into or out of homelessness as indicated by their use of services for the "homeless" (Dennis, 1991; Dennis & Iachan, 1992; Etheridge, Dennis, Lubalin, & Schlenger, 1989; James, 1991; Taeuber & Siegel, 1991). The transitional population is marginally or precariously housed and composed of many who have prior histories of homelessness. Its members are identified by (a) use of soup kitchens, health care clinics, and outreach programs for homeless people, or (b) pending departure from an institution (e.g., hospital, jail) with no resources or place to go.

1.5.2 Population Coverage and Defining Sampling Frames

The two-tiered definition of homelessness (i.e., literal and transient) implies the need to include soup kitchens, day programs, and institutions as sampling sites. Although shelters and streets may suffice as sampling sites for identifying people who are literally homeless, they would have missed half of the people surveyed in Chicago's soup kitchens during the mid-1980s (Sosin, Colson, & Grossman, 1988). A second reason for including this second tier is that experimental programs to reduce homelessness among people with possible mental illnesses or other problems often start with people discharged from hospitals or jails (Etheridge et al., 1989; Huebner & Crosse, 1991).

One of the more compelling reasons for sampling multiple types of sites is that shelter surveys alone may under represent subgroups of potential interest and thus may introduce a potential bias in information about homeless people (Dennis & Iachan, 1991; Iachan & Dennis, 1991). A recent review (Dennis, 1991) found 13 other probability-based homeless studies that attempted to address this potential bias by supplementing shelter surveys with samples of people drawn from other locations (Breakey et al., 1989; Burnam, Koegel, & Duan, 1990; Burt & Cohen, 1989; Farr, Koegel, & Burnam, 1986; Hamilton, Rabinovitz, & Alschuler, Inc., 1986; Ringwalt & Iachan, 1990; Roberston, Piliavin, & Westerfelt, 1990; Rossi et al., 1986; Vernez et al., 1988).

1.5.3 Risk and Multiplicity Over Time

Because the homeless population is geographically mobile, sampling schemes should take into account that multiple selections of the same individuals over time are possible and that the potential exists for time-related trends to bias the data (i.e., drug use may peak when people receive welfare checks or are paid at the beginning of the month). Capture-recapture methods, which have been used successfully in other research areas, have often been proposed to estimate populations over time (e.g., the number of unique people who are

homeless in a year); however, no applicable statistical model has yet been demonstrated to be effective with the homeless population (Cowan, Breakey, & Fischer, 1988).

Determining the number of people who could be double-counted and the overlap among multiple frames are common problems in designing a probability-based sample of the homeless population. When an overlap cannot be defined away or overlap is suspected, it is necessary to measure and adjust for the overlap in order to obtain accurate population estimates. In studies of the homeless population, assessing the potential for double counting has been done by asking people about their sleeping quarters and/or service utilization in the last 7 to 30 days (e.g., Burt, 1992; Burt & Cohen, 1989; Farr et al., 1986). A common practice is to extrapolate this number to the last 12 months or a lifetime. A problem with this technique is that the same individual may become homeless at several points in a year. Intermittently homeless people may bias the resulting adjustments and produce annual estimates of unique episodes, not unique individuals.

A second set of time-related problems relevant to sampling homeless people includes the effects of seasonal changes on use of service systems (Dennis, Iachan, Thornberry, & Bray, 1991). Seasonality affects the number and distribution of homeless people and can influence the optimal allocation of the sample. For example, because more people seek shelter in cold weather, more observations are required from shelters than from the streets in the winter, and conversely in the spring. Sampling over time can control for much of this variation and allow seasonal trends to be examined (Iachan, 1989).

2.0 OVERVIEW OF METHODOLOGY

This chapter provides an overview of the sampling, survey, and analysis methodology used in the Homeless and Transient Population Study. A detailed discussion of methodological issues is provided in *Appendix D*.

2.1 Definition of Target Population

The study focused on people who were either literally homeless or at risk of homelessness. An eligible person met one of the following conditions:

- someone who stayed overnight in an emergency shelter for homeless people, runaways, or neglected or abused women;
- someone who stayed overnight in a house, apartment, or room paid for with municipal emergency housing funds;
- someone who stayed overnight in a nondomicile, such as a vacant building, public or commercial facility, city park or car, or on the street;
- someone whose regular place to stay was a nondomicile regardless of where he/she stayed the prior night (e.g., people who traded sexual favors for shelter or spent one night in a hotel or hospital); or

- someone who was using a soup kitchen or emergency food bank serving the homeless population.

A screener was administered to potential respondents in the street and encampment settings to exclude those who were not literally homeless. This screener was used at the soup kitchen sites to allow a subgroup of literally homeless people to be identified, but it was not used to exclude people. It was not necessary to use the screener among shelter users.

People who were cognitively impaired and could not complete the interview were excluded. Impairment was defined by extreme intoxication or scoring more than nine on the Short Blessed Exam (Katzman, Brown, Fuld, Peck, Schecter, & Schimmel, 1983). The Short Blessed Exam was an addendum to the main questionnaire for use when interviewers suspected that respondents were too cognitively impaired to complete the interview.

2.2 Overview of Research Design

The research was designed to develop estimates of drug use and characteristics of the homeless and transient population in the DC MSA on an "average" day between February and June 1991. Four temporal samples of 16 days each were selected in the months of February, March, April, and June 1991, at a rate of 4 days per week. Spatially there were one to two samples (with replacements) from each of the four sample frames: two samples of shelters, one sample of soup kitchen meals, one sample of encampment clusters, and two-stage samples of street census tracts and blocks. The data in this report are based on 908 interviews, including:

- 477 interviews with residents in 93 shelters during 64 days randomly sampled in February, March, April, and June 1991;
- 224 interviews with patrons of 31 soup kitchens and food banks during 16 days randomly sampled in June 1991;
- 143 interviews with literally homeless people from 18 major clusters of encampments during 16 days randomly sampled in June 1991; and
- 64 interviews with literally homeless people from an area probability sample of 432 census blocks sampled from the entire MSA during 48 days randomly sampled in February, March, and April 1991.

The months and number of days vary among the sampling frames because the study design was changed at the end of April 1991 to address several problems with the street component. These problems included higher than expected risks to the safety of interviewers, lower than expected numbers of completed interviews, and higher than expected overlap between the street and alternative sampling frames. The initial design used random samples of shelter and street people as a replication of the Chicago study (Rossi et al., 1986). In the redesign, which was implemented in June 1991, the shelter sample was maintained, but the random street sample was replaced with samples from soup kitchens and encampments. The changes in the design and their implications for the analysis are discussed in *Appendix D*.

The institutional response rate for shelters and soup kitchens combined was 82.6%. The response rate for eligible individuals across the four frames was 86.1%. The street and encampment components include screener data on 356 people to determine whether they were literally homeless. Observational data were collected on all 1,378 people who were approached across the four frames, including people who completed an interview, broke off an interview, were not literally homeless, were too cognitively impaired to complete an interview, or refused to do a screener or main questionnaire. The screener response rate was 65.6%, and observational data were obtained on 99.9% of all individuals approached.

Table 2.1 summarizes the sample design, actual sample, and response rates for the four frames. *Appendix D* provides detailed descriptions of the sampling design and response rates, including an analysis of the potential for screener nonresponse bias in the street/encampment frame.

2.3 Overview of Survey Methodology

The interviews were anonymous and conducted in-person, with the exception of seven in domestic violence shelters that were self-administered to ensure respondent privacy. The interview was designed to last about an hour but varied with the extent of the respondent's drug use history and problems. The median interview length was 40 minutes, with a range of 10 to 185 minutes, and 90% of the interviews were completed in 20 to 70 minutes. All respondents were given \$10 at the end of the interviews to compensate them for their time. Street and encampment respondents were offered juice, coffee, and pastries. The shelter and soup kitchen providers were offered packages of toothbrushes, diapers, or coffee and creamer to compensate them for allowing the on-site interviews to be conducted. Observational data were collected on everyone who was approached, regardless of his/her eligibility or level of participation. People who were intoxicated or cognitively impaired were excluded, as explained earlier.

The study presented situations and problems different from those encountered in a general household population survey. The interviewers had to exercise judgment and sensitivity toward the homeless population and feel comfortable in an unusual data collection environment. The ideal interviewer was one who had experience with both survey interviewing and the homeless population. Because persons with both qualifications were difficult to find, individuals who had experience with homelessness were preferred on the grounds that their expertise with this population would facilitate entree, rapport, trust, and credibility in the interviewer-respondent relationship. Local providers helped identify individuals who provided services to homeless people, such as outreach workers, shelter operators, or individuals who had been or were themselves homeless. Of the 24 data collectors assigned to the street component of the study, 8 were shelter staff members and 14 were currently homeless.

Data collectors attended a 3-day training session on implementation of the sampling and data collection procedures, conduct of the questionnaire, and interviewer-interviewee interactions. Some of the issues addressed during training were:

- ways to interact sensibly and sensitively with homeless individuals;
- different approaches to people living on the street and those living in shelters; and

Table 2.1 Summary of Design, Response Rates, and Actual Sample

Component/Sampling Stage/Unit	Method of Random Sampling (Period)	Probability (Size Measure)	Response Rate (%)¹	Actual Sample
1. Shelter sample				
1a. Days ²	Stratified by week (2/91-4/91,6/91)	Equal	100.0	64
1b. Shelters	Stratified by bed capacity	Equal within strata	78.6	93
1c. Clients	Simple systematic	Equal	89.9	477
2. Soup kitchen sample				
2a. Days ²	Stratified by week (6/91)	Equal	100.0	16
2b. Meal sittings ³	Probabilities proportionate to size	(Avg # of people served)	96.9	31
2c. Clients	Simple systematic	Equal	75.2	224
3. Encampment clusters				
3a. Days ²	Stratified by week (6/91)	Equal	100.0	16
3b. Clusters ⁴	Certainty	Equal	100.0	18
3c. People approached ⁵	Certainty	All	91.0	153
3d. Literally homeless ⁶	Certainty	All	97.9	143
4. Street sample				
4a. Days ²	Stratified by week (2/91-4/91)	Equal	100.0	48

4c. Blocks	Stratified by expected density	Equal within strata/month	93.0	432
4d. People approached ⁵	Certainty	All	57.3	203
4e. Literally homeless ⁶	Certainty	All	80.0	64
Total institutions (shelter and soup kitchen)			82.6	123
Total observations (people approached regardless of eligibility)			99.9	1,378
Total screener respondents (encampment and street only)			68.2	356
Total respondents			86.1	908

¹Excludes institutions that no longer served homeless people who were cognitively impaired; days, clusters, tracts, and individuals were sampled without replacement; shelters, meals, and blocks were sampled with replacement; detailed breakdowns of the institutional and individual response rates are given in Tables A.2 and A.3 of Appendix A.

²Days were sampled from 4-week periods in February, March, April, and June 1991, with the shelter component using days from all 4 months, the soup kitchen and encampment components only using days from June, and the street component using days from February, March, and April. See text.

³Because some programs served multiple meals, had multiple sittings for a meal, or made multiple stops with food wagons, the sitting (or stop) was used as the primary sampling unit.

⁴Encampments were defined as contiguous census blocks and were grouped into clusters ranging in size from 1 to 160 census blocks.

⁵Excludes people in uniform (e.g., police), engaged in work (e.g., taxi drivers, newspaper deliverers), and illegal activities (e.g., breaking and entering, prostitution).

⁶Someone who stayed in a shelter or in a nondomicile during the past night or who lacks regular and reliable access to a domicile (e.g., someone trading sex for shelter).

- how to be prepared for potential problems related to security and safety.

The training sessions included instructions from a psychiatric social worker employed by a local shelter and discussions of observations by the data collection staff on their personal experiences with homelessness. All teams were observed in the field by their supervisors and the research staff. They also attended 2-day follow-up and refresher training sessions in March and May 1991.

Data collectors were provided with special supplies to prepare them for their data collection tasks and to ensure their safety. These included an orange backpack, white jacket, flashlight, hand-held foghorn, and cellular telephone. Each of the two street supervisors used a rented van to transport interviewers to their assigned blocks. Interviewers were sent out in teams of two to five people as a security precaution. Several security problems occurred in the street component, including threats from drug dealers, gangs, and other criminal elements in the community, but none of the threats originated from a homeless person. A more detailed discussion and evaluation of the equipment and data collection procedures is provided in *Appendix D*.

2.4 Definitions of Key Demographic, Homelessness, and Substance Use Measures

Throughout this report, three sets of variables are used to describe homeless people. They are (a) demographic characteristics, (b) homelessness characteristics, and (c) drug/alcohol use. The demographic and drug/alcohol use variables are comparable to those used in the 1990/1991 NHSDA (NIDA, 1991a). The homelessness correlates are comparable to those used in prior research (Burt & Cohen, 1988; Dennis, 1991; Farr et al., 1986; Milburn et al., 1990; Rossi et al., 1986) and by the Interagency Council on the Homeless (1991). The actual number of respondents in each demographic and homelessness category is given by frame in *Appendix D*.

The demographic correlates of drug use in this analysis include sex, age, race/ethnicity, marital status, location within the DC MSA, adult education, and current employment. These terms are defined below:

Sex	Categorized as male and female.
Age	Categorized as 12 to 25 years, 26 to 34 years, and 35+ years. The NHSDA categories of 12 to 17 years and 18 to 25 years were collapsed because of small sample sizes.
Race/ Ethnicity	Following the current U.S. Bureau of the Census classification, persons were grouped into four racial/ethnic groups: white, black, hispanic, and other. Persons referred to as "white" are those who reported that they are "white," but "not of Hispanic origin." Similarly, persons referred to as "black" are those who reported being "black," but "not of hispanic origin." Because relatively few respondents were classified as "other," separate prevalence estimates were not developed for this group, although they were included in the overall prevalence rates.

Marital Status	Categorized as single (never married), currently married (including living as married), and divorced/widowed.
Location	The DC MSA is categorized into three geographic locations: the District of Columbia; Maryland (including the Maryland counties of Calvert, Charles, Frederick, Montgomery, and Prince Georges); and Virginia (including the Virginia counties of Arlington, Fairfax, Loudoun, Prince William, and Stafford, and the Virginia cities of Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park).
Adult Education	Categorized as less than high school, high school graduate, and any college. As in the NHSDA, individuals with general equivalency diplomas (GEDs) were not treated as high school graduates. This variable was not applicable for persons aged 12 to 17.
Current Employment	Categorized as full-time, part-time, unemployed, and other (retired, disabled, homemaker, student, or not in the labor force). This variable was not applicable for persons aged 12 to 17.

Three variables are used to summarize homelessness. First, the number of prior episodes and length of the current episode are combined into a summary measure called "stage of homelessness." This measure is based on a typology developed by Farr, Koegel, and Burnam (1986) and recently expanded by Dennis (1991). Second, the types of service the person has used in the past month are summarized both overall and in terms of the specific services used. Third, the actual location where the respondent was found and sampled from is identified as the sampling location. The specific terms are defined as follows:

Stage of Homelessness	Categorized as newly homeless (first time and less than 6 months), chronically homeless (first time and more than 6 months), intermittently homeless (more than one episode of homelessness and currently homeless), and at risk of homelessness (using a soup kitchen but not literally homeless). In addition to currently using homeless services, the majority of people at risk of homelessness also had histories of being homeless (i.e., those who are transient and precariously housed).
Past Month Service Use	Categorized by use of services in the past month (shelter, soup kitchen, both, or none). The "none" comes only from the street and encampment samples.
Sampling Location	Categorized by the location where the interview took place (shelter, soup kitchen, encampment, street).

Measures of substance use include reports for cigarettes, alcohol, marijuana (including hashish), cocaine (including crack), inhalants, hallucinogens (including phencyclidine [PCP]), heroin, and non medical use of each of the prescription-type psychotherapeutic drugs (stimulants, sedatives, tranquilizers, and analgesics). Separate estimates were obtained for crack and stimulants. (Separate estimates for methamphetamine [ice] use were not warranted because 80 few people reported even lifetime use n=6.)

To examine the extent of involvement in illicit drug use, two summary measures were constructed: "any illicit drug use" and "any illicit drug use except marijuana." The prevalence of use of illicit drugs, alcohol, and tobacco was examined for three time periods:

- Past Month Use** Use of a substance one or more times in the month before the interview (also referred to as current use).
- Past Year Use** Use of a substance one or more times in the year before the interview.
- Lifetime Use** Use of a substance at least once in the individual's lifetime.

Data on heavy alcohol use in the past month were also collected. Heavy alcohol use was defined as having five or more drinks per occasion on 5 or more days in the past month (i.e., drink heavily at a rate of at least 5 days/30 days). If the person had become homeless in the past 30 days, a comparable criterion was used based on the number of days of heavy drinking while homeless divided by the number of days homeless. For example, if a person drank heavily (5 or more drinks per occasion) on 3 days during a 15-day episode of homelessness, heavy drinking would be evaluated on the basis of 3 days/15 days. Because this rate is higher than weekly use (i.e., $3/15 = 6/30 \geq 5/30$), the person would be considered a heavy drinker.

Three types of illicit drug users and three types of alcohol users were examined in this analysis to assess the correlation between drug use and other problems. For illicit drug use, classifications were:

- Current Drug Users** People with any illicit drug use in the past month.
- Past Drug Users** People with lifetime illicit drug use, but no past month illicit drug use.
- Nonusers of Drugs** People with no history of illicit drug use.

For alcohol use, classifications were:

- Heavy Alcohol Users** People who had five or more drinks on 5 or more days in the past month (or the prorated equivalent—5/30—while homeless).
- Other Alcohol Users** People with lifetime histories of alcohol use, but no heavy alcohol use in the past month.

Nonusers of Alcohol People with no lifetime history of alcohol use.

2.5 Analytic Approach and Statistical Significance

2.5.1 Adjusting for Potential Multiplicity

The Homeless and Transient Population Study developed theoretically unbiased estimates of the size and characteristics of the homeless population in the DC MSA for an "average" day during the data collection period. The effects of potential multiple counting were minimized by only working in a few areas on any given day, temporal stratification, and random assignment of sampled units (e.g., shelters, soup kitchens, encampments, blocks) to days. Even within this "average" day, however, a respondent could be in more than one sample frame, as shown in Figure 2.1.

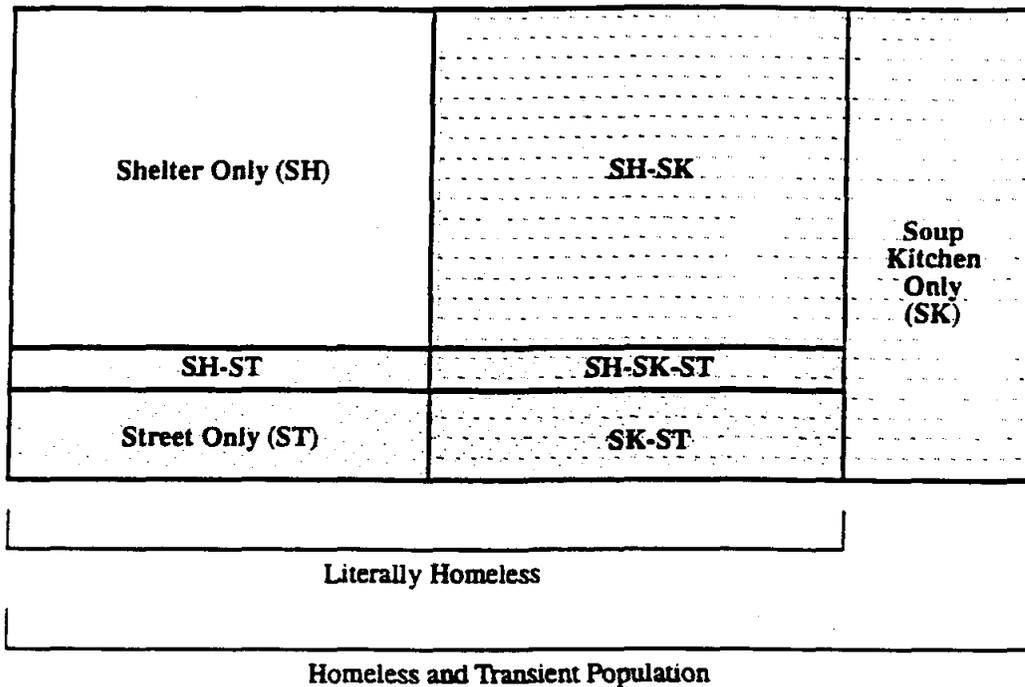

For example, a person could be sampled in a shelter, leave in the early morning and be sampled again on the street, and/or go to a soup kitchen for breakfast. Twenty-eight (3%) of the homeless people reported being interviewed more than once over the entire period of data collection. Of those 28, however, 15 gave dates outside the actual period of data collection (possibly confusing this study with other research projects), and no one reported being interviewed twice in the same day or even the same week. Nonetheless, it is the theoretical potential for being sampled more than once that affects a person's probability of selection and, consequently, creates the need for a multiplicity adjustment to the analysis weights.

Respondents were asked about the extent to which they had gone or were planning to go into shelters or the street (4:00 to 5:30 A.M.) on the sampled day. They were asked how often they use soup kitchens. The responses to these questions and the location of the interview were used to classify people as having been (or as probably going to be) in a shelter, soup kitchen, and/or street location (including the encampments). Respondents were then categorized as having been in one of the seven possible combinations of places where they could have been sampled in the assigned 24-hour period. Weights were adjusted for people who could have been selected in more than one place by dividing the weights by two for anyone who could have been sampled from two locations, and by three for those who could have been sampled from three locations. On average, this procedure evens out the weights across the two or three sources.

2.5.2 Identifying Low-Precision Estimates

The sample for the DC*MADS Homeless and Transient Study was designed to produce estimates representative of the homeless and transient population on an average day between February and June 1991. Like any sample survey, the estimates shown in this report are subject to two types of error: non sampling error and sampling error. Non sampling error results from factors such as non response, misreporting of data by the respondent, and miscoding of responses. Although the extent of non sampling error cannot be precisely measured, attempts can be made to reduce it through quality control procedures and other means. *Appendix D* describes the quality control procedures that were used to reduce non sampling error in this study.

Figure 2.1 Potential Universe and Sampling Locations for Surveying the Homeless and Transient Population

Note: For the purposes of this schematic, encampments can be thought of as a subset of the street frame.

Source: NIDA 1991 DC*MADS Homeless and Transient Population Study.

Sampling error results from collecting data from a subset rather than from everyone in the population. Also known as sampling variability, sampling error is the variation among a set of estimates that would be observed if repeated samples of the same type were drawn from the same population. The magnitude of sampling error depends on (a) the inherent variability of the measured attribute in the population; (b) the sample size; (c) the extent of homogeneity of the sample on the variable in question (based on factors such as similarity of respondents within sample clusters and dissimilarity between clusters); and (d) the type of sampling and estimation procedures used. Sampling theory provides a basis for calculating the degree of sampling error; two commonly reported measures are the standard error (SE) and the relative standard error (RSE), i.e., the SE expressed as a percentage of the estimate. SEs are used to compute confidence intervals for estimates and also enter into the calculations required to test the statistical significance of the difference between two estimates.

Estimates subject to a high degree of sampling error are considered to have low precision. Low precision has been defined in many ways with no common definition used across various sample surveys. Thus, as in specifying an alpha level for conducting tests of significance or constructing confidence intervals, there will always be some subjectivity in defining low precision.

The precision criterion applied to the estimates in this report was originally developed for the 1991 National Household Survey on Drug Abuse and is based on the RSE of the natural logarithm of the estimate. This criterion, which is discussed in detail in Appendix A, is somewhat conservative and tends to require relatively large sample sizes to obtain an acceptable level of precision. When this criterion is used, low precision may occur if prevalence rates are close to zero or 100 percent or when the number of respondents in a particular subgroup is small. Application of this precision criterion to the DC*MADS data results in a large number of estimates being identified as low in precision. These low precision estimates are shown and flagged with an asterisk (*). Flagged low-precision estimates are presented in recognition of the exploratory nature of the DC*MADS studies and because of their potential utility to investigators involved in related areas of research. The reader should exercise caution in using these estimates and is encouraged to use the SEs in conjunction with the estimates.

There is one exception to the presentation and flagging of low-precision estimates. Estimates based on data from fewer than 30 respondents tend to exhibit more extreme sampling variability and are not shown in this report. These estimates have been eliminated either by collapsing table cells into larger groups or by not displaying the affected categories. Consequently, certain categories for some variables, such as the "other" category in race/ethnicity, are not shown in the tables.

2.5.3 Testing for Statistical Significance

Pair wise z-test comparisons were made using SUDAAN (Research Triangle Institute [RTI], 1990) software for rates of marijuana, cocaine, other illicit drug, and alcohol use between each of the key demographic and homeless subgroups. With SUDAAN, these z-tests examine the magnitude of the difference between the rates while taking into account the size of the sample cluster effects resulting from the sample design and the variation among sample members. A difference in rates of use is defined as "statistically significant" when there is a

0.95 or greater probability that the two populations being compared actually have different prevalence rates. Differences that are statistically significant at the 0.05 level (0.95 nondirectional probability) are noted in the text as $p < .05$.

Statistically significant differences may not be found even though the rate for one group may be from 50% to 100% higher or lower than for the comparison group if the rate of use is low. For example, if the rate of use for one group is 1% and the rate of use for the comparison group is 1.5%, it is unlikely that the difference between these two groups would be statistically significant. The magnitude of the difference between these two groups is so small (0.5%) that it is difficult to detect whether the two groups truly differ in their rate of use or if the difference is due to sampling error. Statistically significant differences have been suppressed when one or more of the estimates have low precision. Such a comparison might otherwise be unreliable or misleading. A detailed discussion of testing for statistical differences is included in *Appendix D*.

Appendix D

Methodological Notes

(Adapted from Appendix A of NIDA's *Prevalence of Drug Use in the Washington, DC, Metropolitan Area Homeless and Transient Population, 1991.*)

A.1 Purpose and Overview of This Appendix

The main text of the final report focuses on the key substantive findings and only provides an overview of the methodological procedures. This appendix provides methodological details and an evaluation of the procedures for similar research with hard-to-reach and hidden populations in other metropolitan areas. The Homeless and Transient Population Study attempted to synthesize methodology from several other probability based studies of the homeless population (Breakey et al., 1989; Burt & Cohen, 1989; Hamilton, Rabinovitz, & Alschuler, Inc., 1987; James, 1991; Koegel et al., 1990; Rossi, 1989; Santiago et al., 1988; Vernez et al., 1988). References cited in this and other appendices are given in the alphabetical reference list that follows Appendix E.

This study attempted to sample and interview homeless individuals from four major sampling frames: shelters, soup kitchens, encampments, and street locations. In addition to people who are literally homeless (e.g., on the street or in emergency housing), the eligible population was broadened to include people who had no regular place to go (e.g., someone who spent a single night in a hotel) and people who may be at risk of becoming homeless as indicated by use of a soup kitchen.

This appendix describes four major aspects of the study: sample design, instrumentation, data collection, and analysis. Section A.2 describes the design and implementation of the sampling plan and includes information on the response rates, characteristics of the final sample, and an analysis of the non respondents. Section A.3 discusses the development of instrumentation and includes an analysis of data quality and consistency. Section A.4 describes field preparation, interviewer training, and data collection; it includes an analysis of the quality control methods used and fieldwork. Section A.5 discusses the development of the analysis weights, the analysis, and validity of the responses. Section A.6 provides the relative rates of drug and alcohol use in the DC MSA Household population. Section A.7 summarizes the proportion of the budget spent on each of the various study activities.

A.2 Sample Design

A.2.1 Overview of Sample Design

The study was originally designed to cover the entire population of "literally" homeless people in the DC MSA through a random sample of shelters and census street blocks. It included two independent seasonal samples designated as the winter and spring samples, respectively, for shelters and street blocks. The winter sample consisted of interviews from February and March 1991, while the spring sample originally included interviews from April and May 1991 (May was later changed to June). Within each seasonal sample, units were randomly assigned to one of the two months, clustered geographically (half in the center of the

MSA and half farther out), and then randomly assigned as a cluster to randomly sampled days in the month.

Over the first 3 months, it became evident that there were problems with the street component, including risks to the safety of interviewers, a low number of completed interviews, and difficulty in finding eligible respondents. Data collection was suspended in May to revise and implement an alternative sampling design in June. Design modifications included permanently ending the street sample and adding a sample of geographically clustered encampments and a soup kitchen sample in June. The month of May was used to develop the sampling frame of soup kitchens and encampment clusters, revise instrumentation and training materials, and retrain the interviewers.

At the end of the study, 908 interviews had been completed, including:

- 477 interviews with residents in 93 shelters during 64 days randomly sampled in February, March, April, and June 1991;
- 224 interviews with patrons of 31 soup kitchens and food banks during 16 days randomly sampled in June 1991;
- 143 interviews with literally homeless people from 18 major clusters of encampments during 16 days randomly sampled in June 1991; and
- 64 interviews with literally homeless people from an area probability sample of 432 census blocks sampled from the entire MSA during 48 days randomly sampled in February, March, and April 1991.

The modified design permitted expansion of the population coverage across the four frames and an evaluation of their overlap and cost-effectiveness. The modifications introduced several asymmetries that complicated the computation of seasonal estimates and analysis weights (discussed in Section A.5).

The temporal sample was selected as a stratified random sample of 16 days for each of the four (4-week) months: February, March, April, and June. Temporal strata were weeks with 4 days randomly sampled within each week. First-stage, spatial sample units (shelters, soup kitchen meals, encampment clusters, census blocks) were randomly assigned to sampled days to avoid temporal bias in the data collection. The estimate for each sampled day is an unbiased estimator of the homeless population total, so that the mean over the sampled days is an unbiased estimate of the average daily number of homeless people (during a given month or the entire data collection period). This approach eliminates the need to estimate multiplicity across sampled days. An overview of each of the four sampling frames is provided below. Details on building the sampling frames, selecting institutions and geographic sites, selecting and screening individuals, choosing the response rates, identifying characteristics of the final sample, and analyzing non response follow later in this section.

The shelter sample was selected in two stages. At the first stage, a stratified sample of shelters was selected from the seasonal frame. Both winter and spring samples were stratified by size (i.e., shelter capacity). At the second stage, residents of each shelter on the sampled

night were randomly selected with equal probabilities from an intake or resident roster. The shelter sampling rates were specified using expected occupancy data collected prior to the sampled day. Shelters in each month of the study were randomly assigned to 1 of 16 sampled days.

The soup kitchen sample was selected in two stages. At the first stage, site meals (e.g., breakfast, lunch, dinner) were selected with probabilities proportional to size (i.e., expected number of persons served a meal at a single sitting). Many soup kitchens had multiple sittings of each meal or operated programs at multiple sites. An equal number of persons was selected from each sampled meal unit so that the final sample would be approximately self-weighting. Soup kitchens were randomly assigned to 1 of the 16 sampled days in June.

Encampments were identified by the local experts who provided the ratings for the street sample (discussed below). Encampments were contiguous census blocks where homeless people appeared to stay. They were visually verified by means of a drive-by. Locations kept in the certainty sample were those where someone appeared to be homeless. These encampments were then geographically clustered into 18 groups and randomly assigned to 1 of the 16 days sampled in June or two replacement positions for days when no one was found. Although encampment clusters included many census blocks, the largest was smaller than several of the individual enumeration districts and rural blocks in the street sample.

The two seasonal street samples were selected in three stages; sample tracts and blocks were selected with stratified random sampling in the first two of these. Tracts and blocks were rated as high, medium, or low (see Section A.2.2.3) by individuals who provided homeless services in each municipality and by persons familiar with the area, including shelter operators, outreach workers, and Health Care for the Homeless staff. All individuals found in the selected blocks were included in the final sample and screened. The sampled blocks were randomly assigned to one of the two months in each season, grouped into 16 geographic clusters (with 4 to 5 blocks in the center of the MSA and 4 to 5 farther out) and then randomly assigned to 1 of the 16 sampled days in the month.

A.2.2 Building Sampling Frames, Selecting Institutional and Geographic Sites, and Obtaining Cooperation

A.2.2.1 Shelter Sample. Selection of a shelter sample involved development of a complete list of emergency housing facilities in the MSA, including shelters for abused persons and runaways, and hotels and motels from which jurisdictions purchase rooms. The list was initially assembled from the following sources:

- directories compiled by the Interfaith Council of Metropolitan Washington and the United Way of the National Capital Area,
- Metropolitan Washington Council of Governments (COG) Directory, and
- lists requested from the jurisdictions.

In September and October 1990, local experts from each of the 16 municipalities in the DC MSA were asked to verify the list as current and complete and to update it as necessary. Most of the experts worked in local government agencies that provide services and programs for homeless people.

Institutional cooperation was solicited by contacting the director of the sampled program, first by letter, then by telephone. Enclosed with the letter were: (a) a study brochure, (b) a summary of the data collection procedures, (c) a description of the procedural support requested from the shelter, and (d) a copy of the letter to be given to respondents after an interviewer left.

A.2.2.2 Soup Kitchen Sample. Like the shelter frame, the 1990 Interfaith Council's directory of services was used to construct the soup kitchen frame. This was supplemented by the directory of resources compiled by the Public Defender Service, by consultations with the Metropolitan Washington Council of Governments, and by service providers in the greater DC metropolitan area. The protocol used to verify and update the shelter list was repeated for the soup kitchen list. Types of food services at soup kitchens varied, but generally fell into one of three categories: sit-down meals at a specific time, mobile units distributing food along a fixed route, and walk-in food banks. Cooperation was solicited with a letter and study brochure describing the project, followed by a telephone call.

A.2.2.3 Street Sample. Homeless people are mobile and often seek out-of-the-way places where they can safely rest at night. Consequently, selecting the street sample required an efficient design that would represent the homeless street population in the MSA. To this end, it was necessary to identify areas where homeless people would most likely be found between 4:00 and 5:30 A.M.

Municipal experts were asked to identify on a map the census tracts in their municipality with high concentrations of homeless street people, and jurisdictional experts were asked to rate the census blocks as high, medium, or low depending on the number of homeless people in a given block over a varying number of nights. Random samples of census tracts and blocks were then selected, with those rated high and medium having a greater chance for selection. Table A.1 shows the joint distribution of sampled tracts and blocks. The two block samples, selected for the winter and spring periods, were from a single sample of tracts.

A.2.2.4 Encampment Sample. Encampments often contained more than one census block and included parks, vacant buildings, underpasses, and places in forests and along rivers. To be considered an encampment, an area had to have concentrations of homeless people spending the night, as verified by research staff in two separate drive-bys between 4:00 and 5:00 A.M. in the last 2 weeks of May 1991.

A.2.3 Sampling and/or Screening Individuals Within Sites

A.2.3.1 Sampling Shelter Residents. The method of respondent selection within shelters varied slightly depending on the arrangement of the shelter and the method of rostering. Within each shelter, the first step was to develop a roster or list of residents, and then to use a random start and fixed interval to systematically sample who would be approached. Within motels, municipal officials helped to explain the study to residents, who

Table A.1 Original Street Sample Allocation to Strata

Census Blocks	Block Stratum Total ¹	Sampled Census Tracts/Blocks			Total

Source: 1991 NIDA DC*MADS Homeless and Transient Population Study.

were later contacted by research staff. Because many motels were for families, it was necessary to obtain parental permission to interview youth aged 12 to 18 years. The motel residency list was used as the roster for sampling.

A.2.3.2 Sampling Soup Kitchen Patrons. Selection at soup kitchens was similar to the shelter selection method (i.e., systematic random sampling), except that, because the number of people served varied from kitchen to kitchen and day to day, the random start and fixed interval were not preassigned. Instead, the numbers were determined with an on-site sampling worksheet (Figure A-1) after verifying the expected number of individuals at the selected meal that day. Selection was done prior to the meal so that interviewing could occur immediately, with less waiting time for respondents selected later. In food banks, selection often occurred after an individual picked up his/her food basket. Mobile units presented a unique challenge because people did not line up until the vehicle arrived. In most instances, there was not adequate time for pre-meal selection between the time when a line formed and when a mobile unit began handing out food.

If selection was done prior to a meal and a respondent was willing to begin an interview immediately, interviewers were authorized to provide food coupons (\$3 per respondent) as compensation for the missed meal. However, food providers usually allowed these individuals to have a meal after the interview so that the food coupons were rarely used.

A.2.3.3 Screening People in the Street Sample. Interviewers were required to approach everyone in the sampled block unless they were wearing a uniform (e.g., police officers), clearly working (e.g., taxicab drivers, newspaper deliverers, janitors, workers at a construction site), or involved in illegal activity (e.g., prostitutes, drug dealers) and to document the location, time, and outcome for every person they saw, even for those they were not required to approach. Interviewers were instructed not to wake people, but rather to wait for them to wake up. In addition to the \$10 incentive, street respondents were offered coffee, juice, and pastry.

A.2.3.4 Screening People in Encampments. Encampments followed a similar screening procedure as that for the street sample, but often covered larger geographic areas. To cover these areas, the eight- to nine-person team was split into two to three pairs. Records were made for all people seen and approached. An interviewer observation form was completed for everyone approached for screening, regardless of whether he/she participated. The observation form included information on what the person was doing, his/her appearance, and limited demographics.

A.2.4 Response Rates and Final Sample

This section summarizes the actual or unweighted institutional and individual samples, including information on their response rates and characteristics. Table A.2 indicates the number of shelters and soup kitchen meals in the sampling frame, and the number who were ineligible, refused, or agreed to participate. For soup kitchens, the sampling unit was the meal/location/sitting, not the institution per se. Ineligible institutions were those that had stopped providing services to the homeless population. The first set of rows shows the initial sample, the second the replacement sample, and the third the combined or total sample. For both shelters and soup kitchen meals, replacement samples were drawn to reach the desired

Completed	54	38 ²	92 ²	31 ²	123 ²
Institutional response rate⁴	79.4%	77.6%	78.6% ³	96.9%	82.6%

¹The sitting of a particular meal at a given location was the sampling unit; e.g., two sittings of breakfast at the same program were treated as two units.

²Includes one institution that agreed to participate but had no clients on the sampled day.

³Includes three shelters that refused participation in the winter and were not recontacted when they were drawn into the sample again.

⁴(Total completed)/(Total completed + Total refusal).

Source: 1991 NIDA DC*MADS Homeless and Transient Population Study.

number of institutions. The overall institutional response rate was 82.6%, including 78.6% for shelters and 96.9% for soup kitchens.

Table A.3 summarizes the individual response rates. It is divided into two parts - a screener section for the encampment and street samples where people had to be literally homeless to be interviewed, and a main questionnaire section for all of the samples. In each section, the number of people approached is followed by the number of people who were cognitively impaired, refused screening or interviewing, or completed a screener or questionnaire. Note that impairment could have been detected either during the initial screening or during the interview. For the screener section, the number of people who were screened out of the study is listed. For the main questionnaire section, the number of people who broke off an interview before completing the sections on homelessness and drug use is listed. Response rates are calculated as the number of completed screeners or questionnaires divided by the number approached minus those who were cognitively impaired. The overall response rate was 68.2% for the screener, with 91.1% for encampments and 57.3% for the street sample. The overall response rate was 86.1% for the main questionnaire, with 89.8% for the shelter sample, 75.2% for the soup kitchen sample, 97.9% for the encampment sample, and 80.0% for the street sample.

Tables A.4, A.5, and A.6 give the unweighted numbers of respondents in each frame for demographic characteristics, homelessness history and chronicity, and patterns of homeless service use, by sample type and overall.

A.2.5 Analysis of Nonresponse

To address the question of non response, interviewers were asked to complete a three page interviewer observation form on everyone they approached for the study, regardless of their eventual eligibility or willingness to participate. Table A.7 presents the interviewer-observed gender, race, and age of all people who were approached, by their level of participation. They are divided into people who were cognitively impaired, refused to be screened (encampment and street only), screened ineligible (encampment and street only), refused the interview, started the interview but stopped before completing Section C, and completed through at least Section C (this includes six more people who broke off before completing the full interview). The data in the main report are based on people who completed the interview. A total column is provided that includes people who were cognitively impaired, screened ineligible, and excluded from the data set. Table A.8 provides information on interviewer observations of each respondent's appearance, truthfulness, and accuracy by these same levels of participation.

Based on interviewer observations, people who were cognitively impaired were more likely than those completing interviews to be male (76.5% vs. 67.3%), black (77.4% vs. 71.8%), incoherent (65.7% vs. 7.5%), confused (62.9% vs. 4.2%), between the ages of 31 to 40 (68.1% vs. 39.0%), dirty and unkempt (51.4% vs. 9.1%), physically ill (38.6% vs. 0.2%), drunk (37.1% vs. 3.4%), and under the influence of drugs (28.6% vs. 3.8%). Interviewers were more unsure of the truthfulness of replies of those who were cognitively impaired, and more doubtful of the accuracy of their responses.

The institutional response rate for shelters was slightly lower in the spring sample because it included three shelters that refused to participate in the winter and were not

Table A.3 Individual Response Rates

l. Interview response rates ⁵	(89.8%)	(75.2%)	(97.9%)	(80.0%)	(86.1%)

-- Not applicable.

¹Too intoxicated to participate or scoring more than 9 on the Short Blessed Exam (Katzman et al., 1983). See Appendix D for a copy of the Short Blessed Exam.

²Screener response rate was calculated as the number screened divided by the number of people approached minus those who were ineligible due to cognitive impairment [d/(a-b)].

³Not literally homeless (i.e., not spending the night in a shelter or nondomicile).

⁴Respondent broke off the interview before completing homeless and drug sections of survey. See Appendix D for a copy of the questionnaire.

⁵Questionnaire response rate was calculated as the number of people interviewed divided by the number of eligible people minus those who were ineligible due to cognitive impairment [k/(g-h)].

¹Too intoxicated to participate or scoring more than 9 on the Short Blessed Exam (Katzman et al., 1983).

²Encampment and street samples only.

³Only of those eligible.

⁴Interview broken off before completing Section C.

⁵These are the data used in the main report.

⁶Includes people who were too cognitively impaired to be interviewed or who were screened ineligible.

⁷Entries exclude missing data; percentages are column percentages for each item unless noted.

recontacted when they were drawn into the sample again. Ineligible institutions included day programs, child care centers, shelters that had closed, and motels that were not being used for emergency housing. Of the 537 residents approached in shelters (see Table A.3), 6 were too intoxicated or cognitively impaired to be interviewed, 51 refused to participate, 3 broke off before completing the key drug sections, and 477 participated (89.8% individual response rate).

The overall institutional response rate for soup kitchen meals was 96.9% (see Table A.2). The one soup kitchen that refused to participate served meals on an irregular basis and could not fit the survey into its schedule. The five ineligible programs included two that were closed for remodeling, a Head Start program, a program for the elderly, and one that went out of business. Of the 298 residents approached at soup kitchens (see Table A.3), none was cognitively impaired, 74 refused, and 224 participated (75.2% individual response rate). None of the interviews was broken off before the key sections on homelessness and drug use were completed.

All clusters of verified encampments in the sampling frame were visited; thus, there was a 100% completion rate. Of the 180 people initially approached in encampments (see Table A.3), 12 were too cognitively impaired to screen, 16 refused to participate, and 163 completed screeners (91.1% screener response rate). Of the 149 who were screened eligible, 3 were too cognitively impaired to interview, none refused to be interviewed, 3 broke off the interview before completing the key sections on homelessness and drug use, and 143 completed interviews (97.9% individual response rate).

Of the 432 assigned blocks in the street sample, 1 was never found, 24 were not visited because of criminal activities and security problems, 1 was missed, 2 were accidentally repeated, 32 were visited but on a different day than assigned, and 374 were visited on schedule. The 402 unique completed blocks resulted in a 93% completion rate, with 86% completed on the assigned day. Of the 363 people approached in street locations (see Table A.3), 9 were too cognitively impaired to be screened, 151 refused to be screened, and 203 completed screeners (57.3% screener response rate). Of the 84 who were screened eligible, 4 were too cognitively impaired to complete the interview, 16 refused to participate, none broke off an interview, and 64 participated (80.0% response rate).

In street and encampment locations, people who refused the screener (see Table A.8) were more likely than those completing an interview to appear to be going to some place (53.6% vs. 17.6%), carrying their belongings including purses or briefcases (33.1% vs. 8.0%), coming from some place (22.3% vs. 4.1%), and appearing dirty and unkempt (15.1% vs. 9.1%) and less likely to appear neat and clean (55.4% vs. 64.2%), confused (3.0% vs. 4.2%), or shabbily dressed (23.5% vs. 67.7%). There were no major differences between people refusing the main interview and completing it, in part due to the overall response rate (86.1%) shown in Table A.3.

A.3 Data Collection Instruments

A.3.1 Overview of the Instruments

The questionnaire used in this study addressed a number of topics related to homelessness, licit and illicit drug use, treatment experience, legal issues, primary health care,

mental health, employment, entitlement participation, education, and demographic information. Other DC*MADS studies covered similar topics and included questions on homelessness, drug use, and dropping out of high school.

A.3.2 Development

A short, easily administered instrument was needed to ensure respondent understanding and applicability in different environments (e.g., during predawn hours, on street curbs, and in unfavorable weather conditions, with some respondents just waking up or experiencing aftereffects from drug or alcohol use). Questionnaire items were based on the NHSDA questionnaire and prior studies about homelessness (Rossi et al., 1986; Burt & Cohen, 1988; Farr et al., 1986; Milburn et al., 1990; and Dockett, 1989). The mental health items were drawn from the Addiction Severity Index (McLellan et al., 1985) because it was short and had been validated in research on homeless people who had problems with mental illness and alcohol or drug use (Huebner & Crosse, 1991).

A.3.3 Pretesting, Refinement, and Translation

The instrument was pretested in street, shelter, and soup kitchen settings, then circulated for comment to the DC*MADS Advisory Group and others with expertise in the area of homelessness. After further refinement, it was translated into Spanish and given to Spanish-speaking shelter staff to translate and critique. All show cards and letters were printed in English on one side and Spanish on the other so that they could be used for individuals who spoke either language. Four Spanish-speaking interviewers were hired for each of the main data collection teams. During the course of the study, it was necessary to use Spanish with 12 out of 1,378 people who were approached.

A.3.4 Analysis of Data Quality and Consistency

Table A.9 shows the internal consistency of self-reported lifetime drug and alcohol use, with 7.0% (alcohol) to 96.6% (methamphetamines) consistently reporting no use and 1.6% (methamphetamines) to 91.8% (alcohol) consistently reporting use of alcohol and specific drugs. An estimated 0.0% (inhalants) to 1.4% (sedatives, tranquilizers, or analgesics) of the responses were inconsistent as a result of interviewer error. This type of error occurred when a question about lifetime use of a drug was recorded as "no," but the interviewer proceeded to ask and record additional answers to questions about the same drug. Respondent inconsistency was estimated from 0.0% (inhalants and crack) to 0.7% (sedatives, tranquilizers, or analgesics) based on persons who initially said they had never used a specific drug, then later reported using the same drug in combination with alcohol, needing more of the drug to get the same high, trying to cut down on their use of the drug, having withdrawal effects from the drug, or having been treated for using the drug.

Other items not shown in Table A.9 include non response, which was at or below 5% for more than 95% of the items. Exceptions were for items on the amount of income in the past 30 days (with 10% to 20% missing) and the number of weeks the respondent spent in several living situations during the past year (with 5% to 7% missing).

Table A.9 Internal Consistency and Quality of Self-Reported Drug and Alcohol Use

Substance	Consistent Report of No Use		Consistent Report of Use		Interviewer Inconsistency ¹		Respondent Inconsistency ²		Bad/Missing Data ³	
	n	%	n	%	n	%	n	%	n	%
Alcohol	64	7.0	834	91.8	6	0.7	3	0.3	1	0.1
Marijuana	269	29.6	626	69.0	6	0.7	1	0.1	5	0.6
Inhalants	738	81.3	163	18.0	0	0.0	0	0.0	7	0.8
Crack	455	50.1	445	49.0	4	0.4	0	0.0	4	0.4
Other cocaine	465	51.2	430	47.4	6	0.7	1	0.1	6	0.7
Hallucinogens	527	58.0	368	40.5	3	0.3	1	0.1	9	1.0
Heroin	678	74.7	218	24.0	2	0.2	1	0.1	9	1.0
Methamphetamines	877	96.6	15	1.6	5	0.6	1	0.1	10	1.0
Other stimulants	663	73.0	230	25.3	4	0.4	4	0.4	7	0.8
Sedatives, tranquilizers, or analgesics	657	72.4	214	23.6	13	1.4	6	0.7	18	2.0

¹The interviewer made a transcription error by circling the "no" response, but then proceeded to ask other related questions in the same section as though the response had been "yes."

²The respondent reported no use of a drug in Section B of the questionnaire (Specific Drug Use), but then did report using that same drug in Section C (General Drug Use).

³Data in Sections B and C are missing or illegible, or the respondent refused to answer the questions.

Source: 1991 NIDA DC*MADS Homeless and Transient Population Study.

Local officials and service providers gave several suggestions to facilitate respondent understanding and cooperation, including:

- Interview in neutral settings to minimize association of the shelter's services with participation in the study and encourage honesty. A statement in the shelter introduction was added to reassure clients that participation in the study would not affect their ability to receive shelter services.
- Be prepared to schedule appointments for the next evening rather than the next morning because some of the clients were employed.
- Have interviewers sign receipt forms for incentives instead of respondents to protect respondent anonymity.
- Work through municipal offices that provide motel vouchers instead of motel operators to protect the identity of homeless residents willing to participate in the study.

A.4 Data Collection

A.4.1 Overview of Data Collection

This section describes the field preparations, interviewer selection, and training and data collection procedures. It concludes with an assessment of the quality of the field operation.

A.4.2 Field Preparations and Local Advisory Group

Historically, research about homeless people has met with resistance from homeless advocates and others concerned with the impact of research results on community services and resources for the homeless population. To minimize this, the DC*MADS Advisory Group and local service providers were involved in planning for the study, pretesting its procedures and instruments, and recruiting and hiring interviewers. Jurisdictional and local endorsements for the research were obtained from the Washington Metropolitan COG's Homeless Task Force, county officials, and service providers to strengthen the credibility of the study and its acceptance in the community.

Local officials and service providers gave several suggestions to facilitate respondent understanding and cooperation, including:

- Interview in neutral settings to minimize association of the shelter's services with participation in the study and encourage honesty. A statement in the shelter introduction was added to reassure clients that participation in the study would not affect their ability to receive shelter services.
- Be prepared to schedule appointments for the next evening rather than the next morning because some of the clients were employed.
- Have interviewers sign receipt forms for incentives instead of respondents to protect respondent anonymity.
- Work through municipal offices that provide motel vouchers instead of motel operators to protect the identity of homeless residents willing to participate in the study.

A.4.3 Interviewer Selection and Training

The study presented unique interviewing challenges. Interviewers had to exercise good judgment and sensitivity toward the people they approached, especially in the street setting. The ideal interviewer would have had both interviewing experience and, in some capacity, contact with the homeless population. Because persons with both qualifications were difficult to find, prior experience with homeless people was given a higher priority than interviewing experience. The plan to recruit and hire interviewers who were homeless or who

Table A.10 shows the demographic characteristics of the interviewers and the extent of their professional and/or personal experience with homelessness. Several interviewers worked in more than one of the sample frames, so the columns are not mutually exclusive. Of the 35 interviewers who worked on the study, 26 were men and 9 were women; 11 were white, 18 black, and 3 Hispanic; about half were between the ages of 35 to 49; and over half had some college education. Twenty-one of the interviewers had worked with homeless people as service providers, 9 had been or were homeless individuals, and 5 had both worked with and lived with homeless people.

Training for the street and shelter data collection activities was conducted from January 25 to January 27, 1991, and for soup kitchens and encampments on May 31, 1991, in Washington, DC. Lectures, group instructions, and practice sessions were used, along with a training manual that covered such topics as:

- overall purpose and goal of the study;
- procedures that had been used to select shelters, soup kitchens, and census blocks;
- data collection procedures to be followed in shelters, soup kitchens, and on the street, including respondent sampling, and the "sweeps" (scouting, security, and screening) of sampled blocks;
- techniques of interviewing, including soliciting cooperation, asking questions, recording responses, probing, and maintaining neutrality;
- techniques in engaging homeless persons, including issues of sensitivity, security, confidentiality, anonymity, and approaching and interviewing cognitively impaired individuals;
- question-by-question review of all instruments, including mock role playing exercises for paired trainees; and
- administrative procedures, including editing completed instruments, reviewing materials and supplies, supervising others (or being supervised), and reporting production, time, and expenses.

Various training tools and methods were used. Lectures were used to describe the objectives of the study and the preparations that had been made for data collection. Group instruction was used to teach sampling procedures in shelters and soup kitchens and to discuss street procedures. With the use of overheads, data collectors were taught how to complete the block assignment forms (BAFs), shelter assignment forms (SAFs), and soup kitchen assignment forms (SKAFs) and to document their activities in the field. Discussion sessions were held to cover issues on security, sensitivity, anonymity, and confidentiality, and practice exercises were used to teach the trainees how to administer the instruments.

Table A.10 Demographic Characteristics of the Interviewers, by Sample Frame

Demographic Characteristic	Shelter		Soup Kitchen		Encampment Cluster		Street		Total

Source: 1991 NIDA DC*MADS Homeless and Transient Population Study.

One important element in gaining cooperation from the homeless population was the sensitivity of the data collector. Data collectors had to be aware of the stress levels that persons living on the street or in a homeless shelter experience and to treat them with courtesy, patience, and respect. They had to know that individuals in this situation may feel timidity, reluctance, or even hostility when asked for personal information. To address this, training included discussions on sensitivity to homeless people and ways to approach them, especially those encountered on the street, and a presentation by an outreach therapist on "Engaging the Homeless." Additionally, because many of the data collectors had experience with homeless people either as providers of services or because they themselves were homeless, they were able to provide useful suggestions to deal with potential problems. The training manual also included guidelines on how to engage homeless people on the street.

A.4.4 Field Procedures

The basic field procedures for the shelter frame can be summarized as follows:

- Two days prior to the sampled date, data collectors telephoned the shelter contact person to verify existing information and confirm the visit to the shelter. Results of this contact were documented on the SAF.
- If interviewing was to be done at a motel, data collectors contacted the regional office 2 days prior to the sampled date and arranged to obtain the list of individuals who were staying at the motel on the sampled night and their signed consent forms.
- Upon arrival at a shelter, data collectors identified a private place to conduct the interviews and inspected the roster intake form to determine how respondent selection would be done.
- After a client had been selected for interviewing, the data collectors approached him/her to obtain his/her cooperation to be interviewed.
- Data collectors were to complete as many interviews as possible with selected clients. Upon completion of an interview, data collectors gave individual respondents \$10 and signed the incentive receipt forms.
- In shelters that did not have a curfew, data collectors marked blank lines on the shelter roster intake form to indicate selected clients. They explained to shelter staff how to select clients who entered the shelter after the data collector left, what information to give those who were selected, and the information needed from them the next morning.
- Data collectors documented the results of their visit on the SAF.
- The following morning, data collectors telephoned the shelter to obtain information on the cooperating selected clients who entered the shelter after the data collectors left.
- Data collectors documented the results of the telephone follow-up contact on the SAF.

- Data collectors later returned to the shelter to conduct interviews with those clients who were initially selected after the data collectors left the shelter
- Data collectors documented on the SAF the results of their follow-up visits to the shelter to contact those clients initially selected after the data collectors had left the shelter.

The basic field procedures for the soup kitchen frame can be summarized as follows:

- A group of three data collectors and a team leader went to a sampled soup kitchen on the sampled date during specified hours.
- The team leader was responsible for making initial contact upon arrival, selecting respondents, solving any logistical problems, and, assuming time availability, conducting the interviews.
- The team leader obtained from the contact person an estimate of the number of people who would be served (or directly counted them). The information was documented on the SKAF.
- Using a sampling worksheet, the team leader determined the random start number and the interval number. Because the number of people served varied, these numbers were determined on-site after verification of the expected number of people.
- An average of nine individuals were selected with the expectation of interviewing six to seven at each soup kitchen site.
- The initial approach to a selected individual was usually made by the soup kitchen contact person who asked him/her to step out of the line and was informed that he/she had been selected for an interview. The data collector then attempted to elicit cooperation.
- If possible, the selection and approach were done prior to the meal so that interviewing could occur immediately, thus reducing the waiting time for the others who were selected.
- If a person had to wait to be interviewed, he/she was given a study brochure to read. he/she was instructed to return the brochure at the time of the interview. This procedure helped verify that the returning individual was the selected respondent.
- If a private area to conduct the interview was not designated, the data collectors were to locate a private area outside.

Other than how the sites were identified, the basic field procedures for the encampment frames were largely the same. They can be summarized as follows:

- Prior to the sampled morning, the data collection team conducted a scouting sweep of their assigned block. The purpose was to locate the block, assess its size and general

composition, and identify where people might be found sleeping. Observations were documented on the BAF. For the encampments sampled in June 1991, as many census blocks as necessary were combined to define the area.

- Approximately 15 to 20 minutes prior to the screening sweep, the data collection team conducted a security sweep to count the number of people who appeared to be asleep, homeless, engaged in employment, or involved in illegal activities.
- Results of the security sweep were reported via cellular phone to the supervisor and recorded on the BAF.
- During the screening sweep, data collectors inspected all areas in the sampled block where homeless people might be resting, including all open and public places until a locked door was encountered.
- The screening sweep was conducted from 4:00 to 5:30 A.M. on the sampled morning to screen everyone found within the boundaries of the selected block. Screening ended at 5:30 A.M., but interviewing continued until as many interviews as possible were completed.
- Data collectors were to approach as many people as possible and attempt interviews with everyone who screened eligible. Data collectors gave individual respondents \$10 after completing interviews.
- If a person was asleep, the data collectors were instructed to keep an eye on him/her, but to wait until he/she woke up naturally before making an approach.
- If the data collector encountered a risky situation or a large number of people were to be screened, he/she was required to contact the field supervisor by cellular phone for instructions and/or assistance.
- Documentation of every person seen on the block was made on the BAF. This included people who participated, refused, or were not approached because they were involved in business or illegal activity.

The SAF, SKAF, and BAF forms were used to document the following:

- location, contact person, and any special circumstances or agreements known in advance;
- results of preliminary contacts or scouting sweeps;
- extent to which data collectors followed the proposed procedures, and the actual date and time of data collection;
- number of people sampled, approached, refused (or broke off), rescheduled for a later date, and completed an interview;

- prevailing weather conditions; and
- number of completed forms ready for batching and processing.

Each form also provided a space for the data collection team to certify their participation on the shift and to report the results of any callbacks that had been scheduled during the shift.

A.4.5 Analysis of the Fieldwork

This section examines the effectiveness of training, staffing, equipment, and security measures so that the experiences from this study may serve as a model for other data collection efforts involving hard-to-reach and hidden populations in similar environments.

Given the emphasis placed on homeless experience over interviewing experience in hiring interviewers, more training should have been given on standard interviewing techniques and administration of the questionnaire. Specific lessons that were learned include:

- The small number of street interviews conducted in rural and suburban areas kept some of the interviewers from using their training soon enough and often enough, creating the need for repeated follow-up training for the less experienced interviewers. The costs of additional training may have been avoided if interviewers had been rotated between shelters and streets where they could have completed interviews early in the data collection.
- The study benefited from the interviewers' personal and professional experience with homelessness. They knew where to find homeless people on the street and how to engender trust and cooperation from this potentially suspicious population.
- The interviewers were willing to commit to a work schedule of unusual hours and conditions, including shift hours of 2:00 to 6:00 A.M. and interviews in dangerous areas of the city.
- The use of interviewers with homeless experiences had some disadvantages, including a need for more field supervision and monitoring than would be required with professional interviewers, and more assistance with accounting and documentation procedures.

Most of the equipment used in this study worked as planned. The cellular phones allowed the team contact with their supervisor and were invaluable for safety. The backpacks were essential for transporting the many supplies needed to do the work. The flashlights were needed during the predawn data collection hours. The foghorns were rarely used as intended. The results for other equipment were more mixed:

- The effectiveness of jackets as a means of easily identifying interviewers varied with geographic areas. The teams working in suburban locations found them useful

because they made the data collectors visible and local police knew they were not engaged in criminal activity. Interviewers working in the more urban areas, however, chose not to wear them for the very same reason; i.e., to avoid being too conspicuous.

- Food as an incentive did not work in the intended way. Instead, supervisors brought thermoses of coffee each morning, which turned out to be a greater incentive to respondents than the food.
- The vans were useful in the street component of the study, but their nightly presence in high crime areas led to some occasional safety risks to the interviewers.

A.5 Weighting and Analysis Approach

A.5.1 Overview of Analysis Approach

This section provides an account of how the frame-specific and total population weights were constructed. It discusses the implications of conducting weighted analysis through SUDAAN (or SURvey DATA ANalysis software), the low precision rule for prevalence estimates, and testing for statistical significance. It concludes with an analysis of the validity of the responses.

A.5.2 Creation of Frame-Specific Analysis Weights

Depending on the frame, one to three stages of analysis weights (AW) were calculated and then multiplied to create a raw analysis weight for each eligible person. Although the formulas vary, each weight is essentially the product of the inverse of the sampling rate(s) for each stage. Adjustments for institutional and individual non response were used to create an adjusted analytic weight (AW_A) that is valid for within-frame estimates. Potential multiplicity between sample frames within a sampled day is discussed in subsequent sections.

A.5.2.1 Shelter Weights. The raw analysis weights for the shelter interviews were based on a first-stage weight for the shelter facility and second-stage weight for individuals within shelters. The shelters were divided into five strata based on bed capacity, and then randomly sampled within strata. The first-stage weight, denoted as WTSH1 in Equation A. 1, was based on the total numbers of shelters in a stratum divided by the number of shelters sampled within that stratum. The second-stage weight, denoted as WTSH2 in Equation A.2, was based on the total number of people actually in the shelter on the sampled night divided by the number who were sampled. Within shelters, people were selected by systematic random sampling of the intake or bed or emergency housing roster. The raw analysis weight (AW) for the shelter interviews is the product of these two weights and is shown in Equation A.3.

$$WTSH1(h) = N(h) / n(h), \quad (A.1)$$

where

$N(h)$ = total number of shelters in stratum-h and

$n(h)$ = total number of shelters sampled in stratum-h.

$$WTSH2(j) = N(j) / n(j), \quad (A.2)$$

where

$N(j)$ = total number of people actually staying in shelter j on the sampled night and

$n(j)$ = total number of people sampled in shelter j on the sampled night.

$$AW(h, j) = WTSH1(h) * WTSH2(j). \quad (A.3)$$

Two levels of non response adjustments were made in the shelter survey—one for institutional and the other for individual. To compensate for institutional (shelter-level) non response, weighting class adjustments were used. Two weighting classes were constructed—one for the winter sample shelters and one for the spring sample shelters. The adjustment was such that the sum of the adjusted weights over participating shelters in a season was made to equal the sum of the sampling weights for all selected shelters, both responding and non responding.

Individual non response adjustments were made using each municipality as a weighting class. In this way, the sum of the adjusted weights over the respondents in a class should reproduce the sum of the unadjusted weights over all selected persons in the class. Weighting classes for the shelter respondents were constructed to be sufficiently large (in terms of number of respondents) and geographically homogeneous.

Table A.11 presents the basic shelter weights (computation). First-stage weights were computed for each season and capacity stratum and were adjusted within weighting classes (municipalities).

For overall analyses based on the combined samples, the weights were adjusted to account for dividing each seasonal sample into two monthly (sub)samples, then 16 days. This adjustment has the same effect as adding the 16 daily estimates and dividing by the number of estimates being summed (16), but it is preferable because there are two seasonal samples with replacement. The final adjusted analysis weight (AW_A) is valid for describing the shelter population on an average night during February, March, April, and June 1991.

A.5.2.2 Soup Kitchen Weights. The raw analysis weights for the soup kitchen interviews are based on a first-stage weight for the soup kitchen meal and a second-stage weight for individuals served at the meal. The soup kitchen meals were sampled with probability proportional to size (PPS), where the expected number of people to be served in each meal was the measure of size. Some soup kitchen meals were certainty units by virtue of their large size. The first-stage weight, denoted as $WTSK1$ in Equation A.4, is the reciprocal

Table A.11 Shelter Stratum, Stratum Size, and First-Stage Weights 😞 😐 😊

Stratum Number/ Definitions ¹	Winter			Spring		
	Stratum Count	Sample Size	WTSH1 ²	Stratum Count	Sample Size	WTSH1 ²
1 $100 \leq C \leq 500$	17	14	1.214	15	15	1.000
2 $C > 500$	7	2	3.500	6	3	2.000
3 $20 \leq C < 100$	49	26	1.885	41	14	2.929
4 $C < 20$	51	10	5.100	49	4	12.250
5 Motels	28	2	14.000	27	2	13.500

¹The measure of size, C, stands for bed capacity. Shelters with $C > 500$ were divided into smaller units, such as a ward or floor, for sampling purposes. Motels were clustered and sampled by municipality, with all of the motels used by a municipality on a given night being used in the sample.

²WTSH1 is the first-stage sampling weight for shelters.

Source: 1991 NIDA DC*MADS Homeless and Transient Population Study.

of the selection probability for the meals. The second-stage weight, denoted as WTSK2 in Equation A.5, is the actual number of people served in the meal divided by the number of people sampled. People within a meal were selected through systematic random sampling from a line or sitting arrangement. The raw analysis weight, denoted as AW in Equation A.6, is the product of the first- and second-stage weights.

$$WTSK1(i) = S(+)/[ns(i)], \quad (A.4)$$

where

ns = total expected capacity across all meals,
 n = number of meals selected, and
 $s(i)$ = expected meal capacity of meal i .

$$WTSK2(j) = N(j)/n(j), \quad (A.5)$$

$N(j)$ = total number of people actually served at meal j on the sampled day and
 $n(j)$ = total number of people sampled from meal j on the sampled day.

$$AW(i, j) = WTSK1(i) * WTSK2(j). \quad (A.6)$$

Only one seasonal (monthly) sample was used as a weighting class in the institutional non response adjustment. In other words, a single weighting class was used, and this comprised the entire pool of meal sites available in the sampling frame's soup kitchens. Thus, the sum of the (adjusted) weights over the participating units was made equal to the sum of the unadjusted weights over all sampled units.

Weighting classes for individual non response adjustments were three regions: DC proper, Virginia municipalities in the DC MSA, and Maryland municipalities in the DC MSA. The adjusted analysis weight (AW_A) is valid for describing the soup kitchen population on an average day during June 1991.

A.5.2.3 Encampment Weights. All of the encampment clusters were included in the study with certainty, and everyone who was approached and eligible was interviewed. Their raw analysis weights are equal to 1.0. Individuals were screened according to the eligibility criteria discussed in Chapter 2.0.

Individual non response adjustments were made to the encampment sample using the entire encampment sample as a weighting class. In other words, one inflation factor was applied to the individual sampling weights. This was computed as the sum of the weights over all persons screened eligible divided by the sum of the weights over all survey respondents who completed interviews in that sample. The resulting adjusted analysis weight (AW_A) is valid for describing the total eligible encampment population on an average morning during June 1991.

A.5.2.4 Street Weights. The raw analysis weights for the street sample were computed based on the equal probability sample within the tract and block strata described in Section A.2.2.3. The first-stage analysis weight, denoted WTST1 in Equation A.7, is the

number of tracts in each stratum divided by the number of tracts sampled. The weight is the same for all tracts (h,i) within stratum-h. The second-stage analysis weight, denoted as WTST2 in Equation A.8, is the number of blocks in each block stratum divided by the number of blocks sampled. Both the upper and lower parts of Equation A.8 are summed over the tract strata; the joint distribution of sampled tracts and blocks is shown in Table A.1. The raw analysis weight (AW) for each selected block is given by the product of the first-stage tract weight and second-stage block weight and is shown in Equation A.9.

$$WTST1(h) = N(h) / n(h) , \tag{A.7}$$

where

$N(h)$ = stratum-h (low/medium/high) total number of tracts and
 $n(h)$ = sampled tracts in stratum-h.

$$WTST2(j) = M(j) / m(j) , \tag{A.8}$$

where

$M(j)$ = total number of blocks in the stratum-j (low/medium/high) across the selected tracts and

$m(j)$ = sampled blocks in block stratum-j.

$$AW(h, j) = WTST1(h) * WTST2(j) . \tag{A.9}$$

Individual non response adjustments were made to the street samples using the two seasonal samples as weighting classes. In this way, for each of the two seasonal components, the sum of the adjusted weights over survey respondents was made equal to the sum of the unadjusted weights over the entire sample (all persons in the selected blocks in the sample periods). Like the encampment adjustment, this inflation factor was the sum of weights for all people screened eligible divided by the sum of the weights for those who were interviewed; the raw weight (AW) was multiplied by this factor to adjust for interview non response. Like the shelter sample, a second factor was applied to adjust for dividing the seasonal sample and having two seasonal samples with replacement. The resulting adjusted weight (AW_A) is valid for describing the street population on an average morning in February, March, and April 1991.

A.5.3 Creation of Total Population Analysis Weights

Although randomly assigning sampling units to sampled days significantly reduces the potential for within-frame multiplicity (i.e., having more than one chance of being selected), the use of multiple frames raises the problem of multiplicity across frames on a given day. This section provides the rationale for dividing the sampling weights by the frame multiplicity during the 24-hour sampled day, which has been denoted as γ (GAMA in variable names). It then describes the computation of the GAMA adjustment factor, which accounts for potential multiple selection probabilities within a given month and/or frame, and the selection of the optimal adjustment strategy to produce the lowest relative standard errors (RSEs).

A.5.3.1 Rationale of Multiplicity Adjustments. The multiplicity adjustment for an individual is the number of links that an individual may have to the different sampling frames on the sampled day. An example of multiplicities across frames is that a person selected in the shelter component may also be selected in the street sample or soup kitchen sample on that same day. In principle, multiplicities may arise within the same sampling frame (e.g., a person in the street frame for multiple nights has the potential for multiple selections into the street sample). An effort was made to minimize this problem by randomly assigning sampled units to sampled days to produce several small but independent samples.

This mobile and transient population at a particular point in time (day) can be characterized by the sample selected at that particular point in time or day. The (sub)population sizes can then be estimated as an average over the sampled days in the data collection period. Multiplicities then become the number of possible linkages to the frames within a sampled 24-hour period. With this formulation, only an adjustment across frames is necessary.

What follows is a technical definition and justification of the multiplicity adjustment.

Let α index homeless persons at day- t within the DC MSA, $\alpha = 1, 2, \dots, N(t)$; where $N(t)$ is the day- t number of homeless persons and T is the number of days in the data collection period. Let

$$N = \sum_t^T N(t) / T$$

be the average number of homeless persons in the DC MSA per day in the data collection period.

Overall prevalence estimates are designed to estimate the parameter Y/N where

$$Y = \sum_t \sum_{\alpha=1}^{N(t)} Y(\alpha) / T$$

is a total averaged over the time periods. Here, $Y(\alpha)$ is the (0-1) outcome variable for person α .

Let f index frames used for the survey, $f = 1, 2, 3$ corresponding to shelter, soup kitchen, and street/encampment (encampments are a subset of the street frame); and let i index sampling units within frames. The multiplicity (γ) for person α is calculated as the number of linkages that person α has to the sampling structure, as shown in Equation A.10. Dividing the original weights AW_A by their respective gamma (γ_u) adjustments results in unbiased estimates of both population characteristics (Y) and size (N), as illustrated in Equations A.11 and A.12, respectively.

The multiplicities are calculated as:

$$\gamma_{\alpha} = \sum_t \sum_{f=1}^3 \sum_{i=1}^{N(f)} \theta(\alpha, tfi), \quad (\text{A.10})$$

where

$$\theta(\alpha, tfi) = \begin{cases} 1 & \text{if the a person is linked sampling unit - i} \\ & \text{in frame - f at day - t} \\ 0 & \text{otherwise} \end{cases}$$

Prevalence estimates are combined ratio estimates of the form Y/N. To adjust for multiplicity, the numerator of the prevalence estimate is computed as:

$$\hat{Y} = \sum_t \sum_{f=1}^3 \left[\sum_{i=1}^{N(f)} \sum_{\alpha=1}^{N(i)} \frac{I(tfi)W(tfi)\theta(\alpha, tfi)Y(\alpha)}{\gamma_{\alpha}} \right] / T \quad (\text{A.11})$$

where

$$I(tfi) = \begin{cases} 1 & \text{if sampling unit tfi is selected for the sample} \\ 0 & \text{otherwise} \end{cases}$$

and

$W(tfi)$ = sampling weight for unit tfi.

The denominator is similarly computed as:

$$\hat{N} = \sum_t \sum_{f=1}^3 \left[\sum_{i=1}^{N(f)} \sum_{\alpha=1}^{N(i)} \frac{I(tfi)W(tfi)\theta(\alpha, tfi)}{\gamma_{\alpha}} \right] / T \quad (\text{A.12})$$

Operationally, the multiplicity adjustment factor was computed as the sum of the following variables:

$$GAMA = SH + SK + ST,$$

where

SH = 1 if interviewed in a shelter or stayed in one last night, else 0.

SK = 1 if interviewed in a soup kitchen, else (days of soup kitchen use in the last 30)/30.

$ST = 1$ if interviewed in a street/encampment location, reported being in one or expected to be in one during 4:00 A.M. to 5:30 A.M. of the sampled mornings else 0.

The indicator variable for the soup kitchen component, based on questions asked of shelter and street sample persons, measures the relative frequency of SK use during the previous 30 days and takes on values between 0 and 1 (rather than simply 0 or 1).

The calculation of the actual GAMA varied slightly from this formula due to the asymmetry introduced by the design change at the end of April 1991. For the months of February, March, and April, GAMA was calculated using only SH and ST, the only two potential sampling frames during that time. During June, it was calculated using only SH and SK. Although encampments are a subset of the street frame, the overlap was not corrected for between the street and shelter/soup kitchen frame because the encampment part of this overlap represents only 71 out of an estimated 1,423 people. Thus, any correction would be overly conservative for more than 95% of the cases.

A.5.2.2 Optimizing the Multiplicity Adjustment. Even though the use of multiplicity-adjusted weights in the overlapping portions reduces the bias (ideally to zero), it is plausible that this reduction is more than compensated for by an increase in sampling variance. To assess the variance tradeoffs involved in the use of multiplicity estimates, the variances of key estimates were examined under alternative weighting schemes for unions of two domains and two time periods:

- shelter-and-street union in the samples for February, March, and April, and
- shelter-and-soup-kitchen union in the June sample.

For the shelter-street union, three weighting options differing in the treatment of the data from the overlapping portion were considered:

- Option 1: Disregard data from the street sample in the overlap.
- Option 2: Disregard data from the shelter sample in the overlap.
- Option 3: Include data from both samples in the overlap with the multiplicity-adjusted weight.

The first two options used the adjusted analytic weights (AW_A) without multiplicity adjustments, while the third used the GAMA-adjusted analytic weight (AWGAMA_A).

Table A.12 shows the results of an investigation for four key variables: the estimated total number of homeless persons in the union, and three prevalence estimates related to crack cocaine use (e.g., lifetime, past year, past month). For each estimate, the exhibit shows the estimate, standard error (SE), and RSE; the RSE is computed as the SE divided by the estimate. Table A. 12 indicates the lowest RSE option (t) for each domain and each estimate.

It was undesirable to discard part of the observations in the estimation of the overlaps. Thus, it was decided to adopt the third (combined data) option unless one of the other two options resulted in either one of the following precision improvements compared to the first option: (a) yielded a reduction of at least 20% in the RSE for two or more of the four estimates examined (e.g., from .10 to .08 or .12 to .096), or (b) yielded a reduction of at least 15% in the RSE for three or more of the four estimates examined (e.g., from .10 to .085 or .12 to .102). Note that such 15% and 20% reductions in RSE are relative improvements in precision (over the multiplicity-adjustment option).

Based on this investigation, the multiplicity-adjusted weights were selected for use in the two indicated domains, SH_ST and SH_SK, for all estimates combined across frames (i.e., every estimate but the frame-specific estimates). Using these weights, the weighted totals for the different sample segments are shown in Table A.13 by season and by sample component. Combined estimates of the seven population segment sizes are presented in Table A.14. This table also shows the standard error for each estimated segment size and the design effect associated with each such estimate.

A.5.4 Weighted Analysis Through SUDAAN

As noted by Cohen, Xanthopoulos, and Jones (1986), national surveys conducted by government organizations, industry, political organizations, and market research firms need to provide the greatest precision in estimates from sample data for fixed cost and time constraints. Consequently, many national surveys are characterized by design components that include stratification, clustering, and disproportionate sampling.

Such design features complicate the data analysis while reducing the cost of data collection. Data from complex survey designs of this type deviate from the assumption of simple random sampling and require special consideration with regard to variance estimation and analysis.

Statistical software packages are currently available that accommodate these complex survey designs and allow for the generation of variance estimates of statistics expressed in terms of means, totals, ratios, and multivariate regression coefficients. The procedures vary, however, in program capabilities, computational efficiency, and user facilities. See Wolter (1985) for an overview of various computer software packages available and a discussion of criteria for selecting appropriate software for various situations. Three widely used and available software packages are the SUDAAN procedure developed by RTI (1990) the WE Stat VARiance Estimation (WESVAR) procedure developed by Westat (Flyer & Mohadjer, 1988), and the earlier procedures developed by the Statistical Laboratory at Iowa State University (Fuller, 1986).

Because the 1990 and 1991 NHSDA are national surveys of complex design, the SUDAAN software package has been used to generate statistics and variance estimates for the NHSDA Main Findings reports. To account for the design effects, the Homeless and Transient Population Study also used SUDAAN to generate weighted estimates and standard errors.

Table A.12 Estimation Options for Two Domain Unions

Union/Estimation Option ¹ (Unweighted n)	Population Size			Proportion (p) Reporting Crack Cocaine Use								
				Lifetime			Past Year			Past Month		
	\hat{N}	SE	RSE ²	p	SE	RSE ²	p	SE	RSE ²	p	SE	RSE ²
Union of shelter and street (2/91 to 4/91)												
1. Disregard street overlap (n=440)	7,642	789.3	0.103	0.453	0.030	0.086	0.334	0.036	0.108	0.147	0.029	0.191
2. Disregard shelter overlap (n=412)	7,945	748.5	0.102	0.437	0.037	0.085	0.318	0.037	0.116	0.135	0.027	0.200
3. Use multiplicity-adjusted overlap (n=459)	8,113	792.9	0.0981	0.449	0.035	0.0781	0.333	0.035	0.1051	0.149	0.028	0.1881
Union of shelter and soup kitchen (6/91)												
1. Disregard soup kitchen overlap (n=207)	6,473	968.0	0.149	0.519	0.052	0.100	0.413	0.060	0.145	0.235	0.039	0.166
2. Disregard shelter overlap (n=269)	8,805	973.4	0.1111	0.618	0.042	0.0681	0.541	0.045	0.0831	0.337	0.042	0.1251
3. Use multiplicity-adjusted overlap (n=302)	7,695	912.3	0.119	0.574	0.045	0.078	0.342	0.041	0.120	0.292	0.040	0.137

¹Most precise estimate of three options.

¹The three options are to disregard (i.e., exclude) respondents who could have been sampled in the shelter frame, disregard those in the shelter frame who could have been sampled from the other frame (e.g., street, soup kitchen), or use both with a multiplicity adjustment to adjust for the overlap.

²Relative standard errors (RSEs) are calculated as the standard error (SE) divided by the estimate (\hat{N} or p).

To estimate proportions, means, and standard errors in SUDAAN in accordance with the sample design, a stratified, two-stage design was specified that incorporates with replacement sampling at the first stage. For the SUDAAN procedures, strata are represented by the variable VESTR and primary sampling units (PSUs, corresponding to the first stage of sampling) are represented by the variable VEREP.

The variables VESTR and VEREP have frame-specific definitions to incorporate the various sampling schemes and obtain estimates both within and across frames. In the street frame, the strata are defined by distinct cross-classifications of season and homeless concentration, while PSUs are defined by distinct levels of census tracts. In the shelter frame, strata are defined by cross-classifications of season and bed capacity categories, while PSUs are represented by the shelter IDs. In soup kitchens, two design strategies were employed. For each kitchen selected with certainty, a single stratum was formed, and each person selected within these kitchens formed a distinct PSU. For all other kitchens, a single stratum was formed, and the soup kitchen ID formed the PSUs. Finally, because encampments were chosen with certainty, encampment strata were formed from each encampment ID, and people interviewed in each encampment were used to form PSUs.

Table A.15 summarizes the weight and design variables required to run SUDAAN with these data. AW is given as a reference, but it is rarely used. For within-frame estimates, AW_A should be used with the main data set and AW_A1 with the observation and screening data set. For across-frame estimates, AWGAMA_A should be used with the main data set. Note that across-frame estimates should not be made with the observation data set, which covers every person approached (including refusals and persons screened out) because these data do not support multiplicity adjustments (see Table A.7).

The following example shows the SUDAAN program used to generate the estimates in Tables 4.4 and 4.4SE of this report.

This example and description are not intended as a guide to using SUDAAN, but rather as an example of its use with the DC*MADS Homeless and Transient Population Study. Briefly, the SUDAAN program reads data from the SAS file that has been sorted by the sampling levels used in the sampling design, VESTR and VEREP, listed on the NEST statement. The default sampling design, with replacement (WR) sampling at the first Stage, is used to generate better variance estimates for multistage designs. The data have been weighted using the frame multiplicity-adjusted analysis weight, AWGAMA_A, listed on the WEIGHT statement. For frame-specific estimates, the data should be weighted by AW_A, the frame-specific analysis weight. The only estimate option requested is MEANS, which requests the computation of weighted means and their standard errors for all variables on the VAR statement. The TABLES statement specifies the cross-tabulations for which estimates are to be calculated. The variables on the TABLES statement must be listed in the SUBGROUP statement and their number of levels provided on the LEVELS statement. The estimates are printed by specified instructions using the SETENV and PRINT options. The data are output to an ASCII file using the OUTPUT option. For purposes of SUDAAN analyses, consistency codes for features such as legitimate skips, missing, or refusals must be set to either a meaning fill value (e.g., 0, 1) or to a Statistical Analysis System (SAS) missing (e.g., ".").

A5.5 Low Precision Rule for Prevalence Estimates

The Homeless and Transient Population Study was designed to accurately estimate population characteristics as small as 1%. To help policymakers, program planners, and researchers to use the information in this study, weighted standard errors have been provided for every weighted estimate that is given in the technical report. Because most tables also make estimates for subgroups (e.g., Hispanics, women) with smaller sample sizes, low precision estimates that may prove to be less reliable have been flagged with an asterisk (*). These estimates were identified using the suppression rule developed for the DC oversample of the 1990 NHSDA.

Historically, the NHSDA suppression rule was designed to suppress estimates with an RSE greater than or equal to 50% of the prevalence estimate. This RSE is computed by dividing the SE of the estimate by the estimate (n, X, or %). Although the 50% RSE rule has been easy to implement and is easily understood, it has been observed to have some undesirable properties. Specifically, the rule imposes a very stringent suppression requirement on small prevalence rates, but a very lax requirement on large rates. That is, small prevalence rates that do not have relatively large sample sizes are often suppressed, whereas large prevalence rates that have small sample sizes are not suppressed.

Starting with the DC oversample of the 1990 NHSDA, a new suppression rule based on the RSE of the natural log of the estimate has been adopted to better address this limitation of the 50% RSE rule. Specifically, estimates are suppressed and shown as an asterisk (*) in a table or figure when:

RSE $[-\ln(p)] > .175$	for $p \leq .5$, and
RSE $[-\ln(1-p)] > .175$	for $p > .5$.

Note that $RSE[-\ln(p)] = RSE(p)/-\ln(p)$. The new rule is more liberal in allowing small prevalence rates to be published but more stringent in preventing large prevalence rates from being

published than the old rule. Under the new rule, for example, it is impossible for prevalence rates of about 1% to be published unless they are based on a sample size of 150 or more respondents. The old rule would have required a sample size of 400 or more respondents. A 20% prevalence rate requires a minimum sample size of 50 under the new rule, whereas it required only 16 under the old rule.

The Homeless and Transient Population Study used this suppression rule to identify low precision estimates. Because it is a methodological study with a more limited sample size, estimates have been flagged with an asterisk (*) rather than suppressed. For a 95% confidence interval, for instance, the interval estimate would be the estimate in the main table, plus or minus 1.96 times the standard error of the estimate.

Because the expected and overall design effect of the study was over 1.0, we also set the standard error (SE) from a simple random sampling design (SRS) as a lower bound for analyses to control for occasional design effects of less than 1.0 in subgroup estimates. To do this it is necessary to read the SUDAAN output and calculate the SRS SE, to select the maximum of the SUDAAN SRS SEs, and to calculate the RSE. Depending on the SUDAAN PROC and type of statistic, this is done by one of the following methods:

For percentage or prevalence estimates in SUDAAN PROC CROSSTAB, this is done with the following code:

```

1  MEAN=COLPER/100;
2  IF DEFFCOL GT 0.0, THEN SECOL2=SECOL/SQRT(DEFFCOL);
3  SECOLMX=MAX(SECOL,SECOL2);
4  IF COLPER GT 0.0, THEN RSE=SECOLMX/COLPER; ELSE RSE=.;

```

For estimates of proportions (i.e., means of dichotomous, 0-1 variables) in SUDAAN PROC DESCRIPT, this is done with the following code:

```

1  IF MEAN GT 0.0, THEN SEMEAN2=SQRT(MEAN*(1-MEAN)/NSUM);
2  SEMEANMX=MAX(SEMEAN,SEMEAN2);
3  IF MEAN GT 0.0, THEN RSE=SEMEANMX/MEAN; ELSE RSE=.;

```

For population estimates in SUDAAN PROC DESCRIPT, this is done with the following code:

```

1  IF TOTAL GT 0, THEN SETOTAL2=WSUM*SEMEAN2;
2  SETOTMX=MAX(SETOTAL,SETOTAL2);
3  IF TOTAL GT 0, THEN RSE=SETOTMX/TOTAL; ELSE RSE=.;

```

To implement the suppression rule, it is then necessary to calculate the natural log of "p" and test it against the 0.175 limit with the following code:

```

1  IF MEAN LE 0.5 THEN RSELNP=RSE/ABS(LOG(MEAN));
   ELSE IF MEAN GT 0.5, THEN RSELNP=RSE*(MEAN/(1-
   MEAN))/(ABS(LOG(1-MEAN)));
2  IF RSELNP GT 0.175, THEN SUPPRESS='*';

```

The variable SUPPRESS can then be used as a flag after the estimate (as was done in this report) or used to supplant it (as done in the NHSDA).

A.7 Proportion of Budget Spent on Various Study Activities

Proportions of the study budget spent on various activities are presented here to assist researchers who may be planning similar studies. The include:

- 11% for study design, questionnaire development and Spanish translation, meeting with local providers, and pretests and coordination with other DC*MADS studies;
- 9% for developing sampling frame information (including local ratings), drawing the samples, developing sampling weights, clustering and randomly assigning units to the temporal sample, developing and testing sampling weight adjustments for institutional nonresponse, individual nonresponse, seasonal multiplicity, and frame multiplicity;
- 39% for initial and follow-up training, gaining site cooperation, on-site sampling, scouting blocks, security sweeps, interviewing, field editing, field supervision, and quality control;
- 16% for data editing, data entry, computer editing, and creation of a data tape; and
- 25% for creation of analysis variables, computer runs, table creation, data analysis, and report writing.

APPENDIX E

Example Program and Output for Complex Variance Estimation (SUDAAN)

As noted by Cohen, Xanthopoulos, and Jones (1986), large-scale survey conducted by government organizations, industry, political organizations, and market research firms need to provide the greatest precision in estimates from sample data for fixed cost and time constraints. Consequently, many surveys are characterized by design components that include stratification, clustering, and disproportionate sampling. Such design features complicate the data analysis while reducing the cost of data collection. Data from complex survey designs of this type deviate from the assumption of simple random sampling, and thus require special consideration with regard to variance estimation and analysis. Statistical software packages are currently available that accommodate these complex survey designs and allow for the generation of variance estimates of statistics expressed in terms of means, totals, ratios, and multivariate regression coefficients. The procedures vary, however, in program capabilities, computational efficiency, and user facilities. For an overview of various computer software packages available and a discussion of criteria important to selecting appropriate software for various situations, see Wolter (1985). Three widely used and available software packages are the SUDAAN procedure developed by the Research Triangle Institute (1990), the WESVAR procedure developed by Westat (Flyer & Mohadjer, 1988), and the PC-CARP procedure developed by the Statistical Laboratory at Iowa State University (Fuller, 1986).

The 1991 DC*MADS Homeless and Transient Population Study involved a survey of complex design, as described in the survey methodology section of this document. Thus, the SUDAAN software package was used to generate statistics and variance estimates for the study's final report.

The following is an example of a SUDAAN program used to generate the estimates in Tables 4.4 and 4.4SE of the Homeless and Transient Population Study final report. This example includes the example SUDAAN program and the resulting final based on the SUDAAN output. The final tables are reproduced here to add completeness to the example. The SUDAAN program is briefly described below. This example and description are not intended as a guide to using SUDAAN, but rather as an example of its use with the DC*MADS Homeless and Transient Population Study.

The SUDAAN program reads data from the SAS file that has been sorted by the sampling levels used in the sampling design, VESTR and VEREP, listed on the NEST statement. The default sampling design, with replacement sampling at the first stage, is used here. The data have been weighted using the frame multiplicity-adjusted analysis weight, AWGAMA_A, listed on the WEIGHT statement. For frame-specific estimates, the data should be weighted by AW_A, the frame-specific analysis weight. The only estimate option requested is MEANS, which requests the computation of weighted means and their standard errors for all variables on the VAR statement. The TABLES statement specifies the cross-tabulations for which estimates are to be calculated. The variables on the TABLES statement must be listed in the SUBGROUP statement and their number of levels provided on the LEVELS statement. The estimates are printed by specified instructions using the SETENV and PRINT options. The data are also output to an ASCII file using the OUTPUT option. For purposes of SUDAAN analyses, consistency codes for features such as legitimate skips, missing, or refusals must be set to either a meaningful value (e.g., 0, 1) or to a SAS missing (e.g., ".").

The following example shows the SUDAAN program used to generate the estimates in Tables 4.4 and 4.4SE of this report.
